

# Natural resources and geothermal energy in the Netherlands

Annual review 2014

Ministry of Economic Affairs

# **NATURAL RESOURCES AND GEOTHERMAL ENERGY IN THE NETHERLANDS**

**2014 Annual review**

An overview of exploration, production and underground storage

## Preface

As well as reporting on the exploration and production of hydrocarbons, rock salt and geothermal energy in the Netherlands, this annual review entitled 'Natural Resources and Geothermal Energy in the Netherlands' also reports on the underground storage of natural gas, nitrogen, CO<sub>2</sub> and saline water. In so doing it covers all the exploration, production and storage activities in onshore Netherlands and in the Dutch part of the continental shelf that fall under the Mining Act.

The first section of this annual review deals with developments during the year 2014. The first nine chapters deal with the exploration, production and underground storage of hydrocarbons. **Chapters 1 and 2 review** the changes in the estimates of natural gas and oil resources in 2014 and the resulting situation as of 1 January 2015. These chapters also present a prognosis for the gas and oil production for the next 25 years. Due to the issues associated with the induced seismicity in Groningen, the new production plan for the Groningen field has not yet been approved by the Minister of Economic affairs. Only the maximum productivity for 2015 has been established, forthcoming production rates still have to be decided. In this review we keep to the publication of the production forecast from the small fields. The remaining volumes of natural gas and oil are reported in accordance with the Petroleum Resource Management System (PRMS).

**Chapters 3 to 8** contain information on developments relating to licensing, exploration and related matters (seismic surveys, drilling activities, the placing of new platforms and the laying of pipelines). **Chapter 9** summarises the produced volumes of natural gas, condensate and oil. **Chapters 10 to 13** report on the underground storage of substances and on the exploration and production of coal, rock salt and geothermal energy.

The second part of this report comprises annexes giving an overview of the situation as at 1 January 2015, and the developments during preceding decades.

The appendices contain maps giving an overview of the situation as at 1 January 2015, and also a geological time scale.

This report has been compiled by TNO (Geological Survey of the Netherlands), at the request of the Energy Market Directorate of the Dutch Ministry of Economic Affairs. It includes data that the Minister of Economic Affairs is required to supply to both Chambers of the Dutch Parliament in accordance with article 125 of the Mining Act.

The digital version of this review can be found on the Netherlands Oil and Gas Portal:  
[www.nlog.nl](http://www.nlog.nl)

This year the volumes of gas and oil have been expressed in accordance with article 11.3.1. of the Mining Regulations: gas in normal cubic metres and oil (a liquid) in standard cubic metres. Until 2014 the standard cubic metre was also used for liquids.

Facts and figures may be reproduced from this annual review only if the source is fully acknowledged. No rights can be derived from this report.

The Hague, May 2015.

## **Note:**

**In this annual report the natural gas volumes are given in normal cubic metres (Nm<sup>3</sup>). 'Normal' relates to the reference conditions 0°C and 101.325 kPa.**

In a few instances the volumes of natural gas are given in Groningen gas equivalents (m<sup>3</sup>Geq) of 35.17 mega joules gross calorific value per m<sup>3</sup> at 0°C and 101.325 kPa.  
This is explicitly indicated in the text.

Volumes of oil are given in standard cubic metres (Sm<sup>3</sup>). 'Standard' relates to the reference conditions 15°C and 101.325 kPa.

## KEY FIGURES FOR 2014

### Natural gas and oil resources

The natural gas resources as at 1 January 2015 are estimated at 883 billion Nm<sup>3</sup>, of which 671 billion Nm<sup>3</sup> are in the Groningen gas field. The small fields in Netherlands Territory (i.e. onshore) contain 94 billion Nm<sup>3</sup> natural gas; those in the Dutch sector of the continental shelf contain 118 billion Nm<sup>3</sup> natural gas.

Oil resources at 1 January 2015 were 34.7 million Sm<sup>3</sup>, of which 27.8 million Nm<sup>3</sup> are in onshore oilfields and 6.9 million Sm<sup>3</sup> in fields on the continental shelf.

### Hydrocarbon licences

In 2014 one exploration licence was issued for Netherlands Territory: 'IJsselmuiden'. Seven exploration licences were extended. The requests to extend 'Peel' and 'Noord-Brabant' await finalisation of the spatial plan. In 2014 there was one application for an exploration licence and one application for a production licence. The 'Botlek' production licence was split, for the production from Q16-Maas.

Five exploration licences for the continental shelf were issued in 2014. In accordance with EU regulations, the draft decisions for three exploration licences were made known; the definitive decision will follow in 2015. There were six applications for exploration licences in 2014.

Fourteen exploration licences were extended, one application for extension was still being processed at the time of compiling this review. One exploration licence was relinquished. In 2014 there were three applications for new production licences. One existing production licence was relinquished.

For details, see chapters 3 and 4 and annexes 2, 3, 9 and 10.

### Wells

In total, 53 wells were drilled for oil and gas, 20 more than in 2013. Eighteen exploratory wells were drilled in 2014. Of these, nine found gas (these included two gas shows), one found oil and gas, one was an oil show and six were dry. The results for the remaining well had not been made public at the time of compiling this review. Thus the technical success rate was 59%. In addition, four appraisal wells, 18 production wells and 13 wells for storage and water injection were drilled (Territory plus continental shelf). Details can be found in chapter 7 and summary -table 2.

### Natural gas production

In 2014 the volume of natural gas produced from Dutch fields was 66.0 billion Nm<sup>3</sup>. Onshore gas fields accounted for 50.7 billion Nm<sup>3</sup>. Of the total of 66.0 billion Nm<sup>3</sup>, 8.5 billion Nm<sup>3</sup> came from small fields and 42.4 billion Nm<sup>3</sup> from the Groningen gas field. The gas fields on the continental shelf produced 15.3 billion Nm<sup>3</sup>. As a result, total production in 2014 was 17.6% less than in 2013. For details, see chapter 9.

### Oil production

In 2014 a total of 1.81 million Sm<sup>3</sup> oil was produced. This is 37.7% more than in 2013. Territory (i.e. onshore) fields accounted for 0.67 million Sm<sup>3</sup>, which is 12.1% more than in 2013. Production on the continental shelf was 1.13 million Sm<sup>3</sup>, an increase of 59.5%. Average daily oil production in 2014 was 4957 Sm<sup>3</sup>. For details, see chapter 9.

### **Underground gas storage**

In 2014 there was one new application for storage, to stabilise salt caverns in Twente. A total of 4.6 billion Nm<sup>3</sup> of gas was injected into the five existing underground natural gas storage facilities and 3.4 billion Nm<sup>3</sup> was withdrawn. In Winschoten II (the storage cavern near Heiligerlee) 1.3 million Nm<sup>3</sup> nitrogen was injected and 1.4 million Nm<sup>3</sup> nitrogen withdrawn. For details, see chapter 10.

### **Coal**

There are no developments to report for 2014. There are still five coal production licences in force. See chapter 11.

### **Rock salt**

One new production licence for rock salt was issued in 2014: 'Zuidoost-Enschede'. In total, 16 production licences were in force at 1 January 2015. Production of rock salt in 2014 was 6.5 million tonnes. For details, see chapter 12 and annexes 5 and 6.

### **Geothermal energy**

In 2014 there were two new applications for exploration licences for geothermal energy and six exploration licences were issued. Two applications were rejected and two were withdrawn by the applicant. A total of 28 exploration licences were extended. Six exploration licences expired and a further two were relinquished by the licensee. In 2014 one production licence was issued: 'Kampen'.

In 2014 five wells for geothermal energy were completed. See chapter 13 and annexes 7 and 8.

# 1. NATURAL GAS RESOURCES AND FUTURE DOMESTIC PRODUCTION

## INTRODUCTION

This chapter reports on the natural gas resources in the Netherlands and in the Dutch part of the continental shelf. First, it presents estimates of the natural gas resources as at 1 January 2015 and the changes compared with the resources as at 1 January 2014. The procedure for estimating the natural gas resources is explained briefly below. Prognoses are then given for the annual production of Dutch natural gas in the next 25 years (2015–2039).

## Figures

In accordance with the Mining Act (article 13, Mining Decree), every year operators of production licences report their estimates of remaining resources, per accumulation, and their expected annual production. These data are used to estimate the domestic resources of natural gas and the future production of natural gas from domestic reserves. As of 1 January 2013, the data on the natural gas resources are required to be reported in accordance with the Petroleum Resource Management System (PRMS)<sup>1</sup>, enabling a uniform classification of the resources.

## Petroleum Resource Management System (PRMS)

The development of a gas accumulation is normally phased in a number of projects. After the initial development, further projects may be planned, such as extra wells (infill or acceleration), the installation of compression and finally the placing of velocity strings, or the injection of soap. Each of these projects represents an incremental volume of gas that is expected to be produced

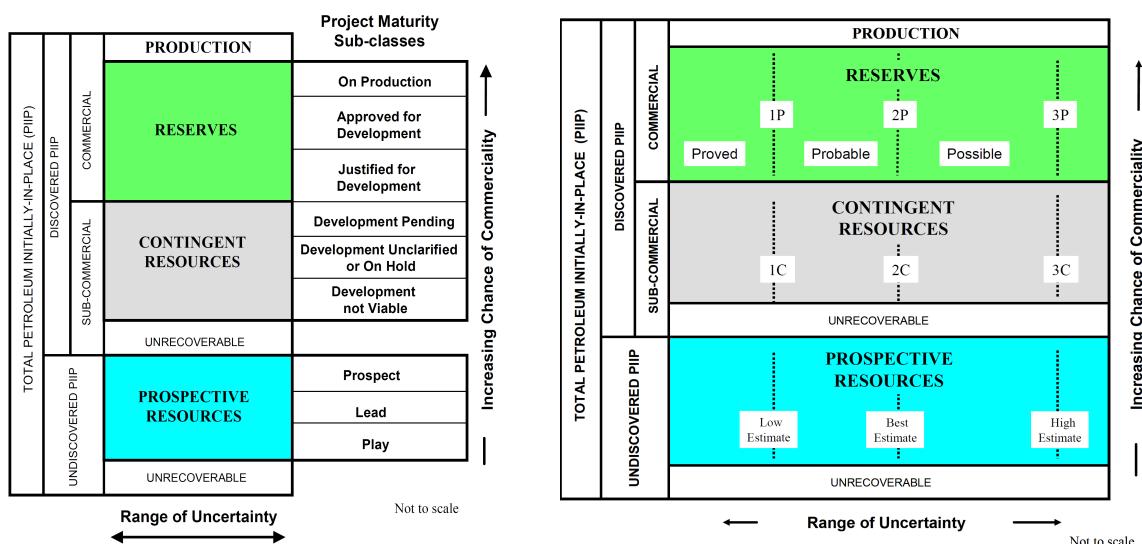

Figure 1. Schematic representation of the PRMS classification<sup>1</sup>

Since oil and natural gas are physically located underground at great depths, hydrocarbon resources are estimated by evaluating the data on the amounts present. All resource estimates have an intrinsic uncertainty. The PRMS resource classification takes account of this uncertainty in its central framework by classifying the gas resources for each project

<sup>1</sup> [Guidelines for application of the PRMS](#), Society of Petroleum Engineers, 2012.

according to the likelihood of recovery. This is depicted along the horizontal axis in figure 1. The expectation is expressed in 1P (proved), 2P (probable) and 3P (possible). Similar categories exist for contingent resources: these are expressed as 1C, 2C and 3C. In turn, these volumes classified in the vertical axis, based on the probability that the project will be realised (probability of commercial viability). The natural gas resources are divided into three main classes: reserves, contingent resources and prospective resources. It is possible to subdivide the classes (figure 1).

The reported resources are a snapshot. This annual review gives the picture for 1 January 2015. The Dutch gas resources reported here comprise the total volume of expected reserves (2P) and the contingent resources (2C), insofar that these belong to the subclass 'development pending'. In this review, the contingent resources subclasses 'unclarified or on hold' and 'development not viable' have not been included in the recoverable gas resources. The paragraph on exploration potential describes how the third class, which is of undiscovered resources (or prospective resources), is determined.

Further information on the PRMS is available at [www.spe.org](http://www.spe.org).

## RESOURCES

The natural gas resource is the volume of recoverable natural gas in proven underground accumulations of natural gas in the Netherlands. A part of the resources initially in place has been produced over the last decades. The volume of natural gas remaining in the proven accumulations that is economically viable to produce is called the remaining reserve. The term 'contingent resource' is applied to the proven resources whose commercially viable exploitation currently depends on one or more criteria.

At 1 January 2015 there were 473 proven accumulations of natural gas in the Netherlands (see table 1) and over half (255) were in production. A further four gas fields were being used to store gas (in addition to the one gas storage facility in a salt cavern). The remaining 114 accumulations were not being exploited, but it is expected that 38 of them will be brought into production in the next five years (2015–2019). It is uncertain whether the remaining 76 will be developed. 99 of the accumulations that were not being produced had been producing previously but their exploitation had been (temporarily) abandoned. There were seven more fields than on 1 January 2014 (see table 5). As compared to 1 January 2014 four new fields have been discovered.

Table 1. Proven natural gas accumulations as at 1 January 2015, classified according to their status

Status of gas accumulation	Territory	Continental shelf	Total
<b>I. Developed</b>			
a. Producing	107	148	255
b. Natural gas storage	5	0	5
<b>II. Undeveloped</b>			
a. Production to start 2015-2019	15	23	38

## RESOURCE ESTIMATES

### Gas resources as at 1 January 2015

On 1 January 2015 the total gas resource in developed and undeveloped accumulations was 883 billion Nm<sup>3</sup> (table 3a).

### Restriction to conventional accumulations of gas

The estimates of resources in this review relate solely to resources that are proven plays, and thus this year too the review is limited to conventional natural gas accumulations and excludes shale gas. At the time of compiling this review, the Minister of Economic Affairs was drawing up a spatial plan and EIA (environmental impact assessment) for shale gas exploration and production, which was expected to be available by mid-2015. These reports will be used to arrive at a decision – expected to be reached by the end of the year – on any shale gas production in the Netherlands.

### Reserves and contingent resources

Figures for the gas resources are given in tables 3a (in billion Nm<sup>3</sup>) and 3b (in billion m<sup>3</sup> Groningen gas equivalents, m<sup>3</sup>Geq). According to the PRMS, a volume of gas qualifies as a reserve if it has been discovered and the gas is assumed to be commercially recoverable by means of well defined projects. Contingent resources are those resources from proven accumulations that are potentially recoverable by means of development projects but which are deemed to be commercially viable only if they meet one or more preconditions. Here, only the contingent resources that are likely to be produced ('Development pending') are presented.

On 1 January 2015 the remaining reserves totalled 818 billion Nm<sup>3</sup>: 650 billion Nm<sup>3</sup> reserves in the Groningen field and 149 billion Nm<sup>3</sup> in the remaining (small) fields. The reserves in the Norg, Grijpskerk, Alkmaar and Bergermeer gas buffers (some 19 billion Nm<sup>3</sup> in total) at the moment these were converted into underground gas storage facilities are reported separately in table 3a under the heading 'UGS'. This 'cushion gas' will be produced when the storage is decommissioned (expected to be after 2040). The Bergermeer accumulation had no remaining reserves at the time of conversion.

Some of the contingent resources are in the developed accumulations, but most are in undeveloped accumulations. According to the PRMS, 21 billion Nm<sup>3</sup> in the Groningen field belong to the contingent resources (table 3a). The small fields contain contingent resources of 20 billion Nm<sup>3</sup> on the Territory (onshore) and 24 billion Nm<sup>3</sup> on the Continental Shelf (offshore).

Table 3a. Netherlands natural gas resources as at 1 January 2015, in billion Nm<sup>3</sup>

Accumulations	Reserves	Contingent resources (development pending)	Total
UGS			
Groningen	650	21	671
Other Territory	55	19	94
Continental shelf	94	24	118
<b>Total</b>	<b>799</b>	<b>19</b>	<b>883</b>

In order to be able to incorporate volumes of natural gas of different qualities in calculations, they have been converted to Groningen gas equivalents (Geq) on the basis of their calorific value (table 3b). The Groningen gas equivalent used to be calculated relative to a calorific value of 35.17 MJ/Nm<sup>3</sup>, the calorific value of the original content of the Groningen field. Since 2010, however, a calorific value of 35.08 MJ/Nm<sup>3</sup> has been assigned to the volume of gas still to be produced from the Groningen field, to reflect a slight change in the composition of the gas produced from this field.

Table 3b. Netherlands natural gas resources as at 1 January 2015, in billion m<sup>3</sup>Geq

Accumulations	Reserves	Contingent resources (development pending)	Total
UGS			
Groningen	648	21	669
Other Territory	61	20	103
Continental shelf	106	27	133
<b>Total</b>	<b>814</b>	<b>70</b>	<b>904</b>

#### Revised estimates compared to 1 January 2014

Table 4 shows the estimates for the Dutch natural gas resources after revision to account for

- New discoveries
- Re-evaluations of previously proven accumulations
- Production during 2014.

Table 4. Revised estimates of expected natural gas resources compared with 1 January 2014, in billion Nm<sup>3</sup>

Area	New discoveries	Re-evaluation,	Production	Total
Groningen field	0.0	-20.7	-42.4	-63.1
Other Territory	0.7	-30.8	-8.0	-38.2
Continental shelf	0.9	-7.6	-15.5	-7
<b>Total</b>	<b>1.6</b>	<b>-43.9</b>	<b>-66.0</b>	<b>-108.3</b>

The net result is a decrease of the resource by 108.3 billion Nm<sup>3</sup> compared with 1 January 2014. A brief explanation of the figures follows below.

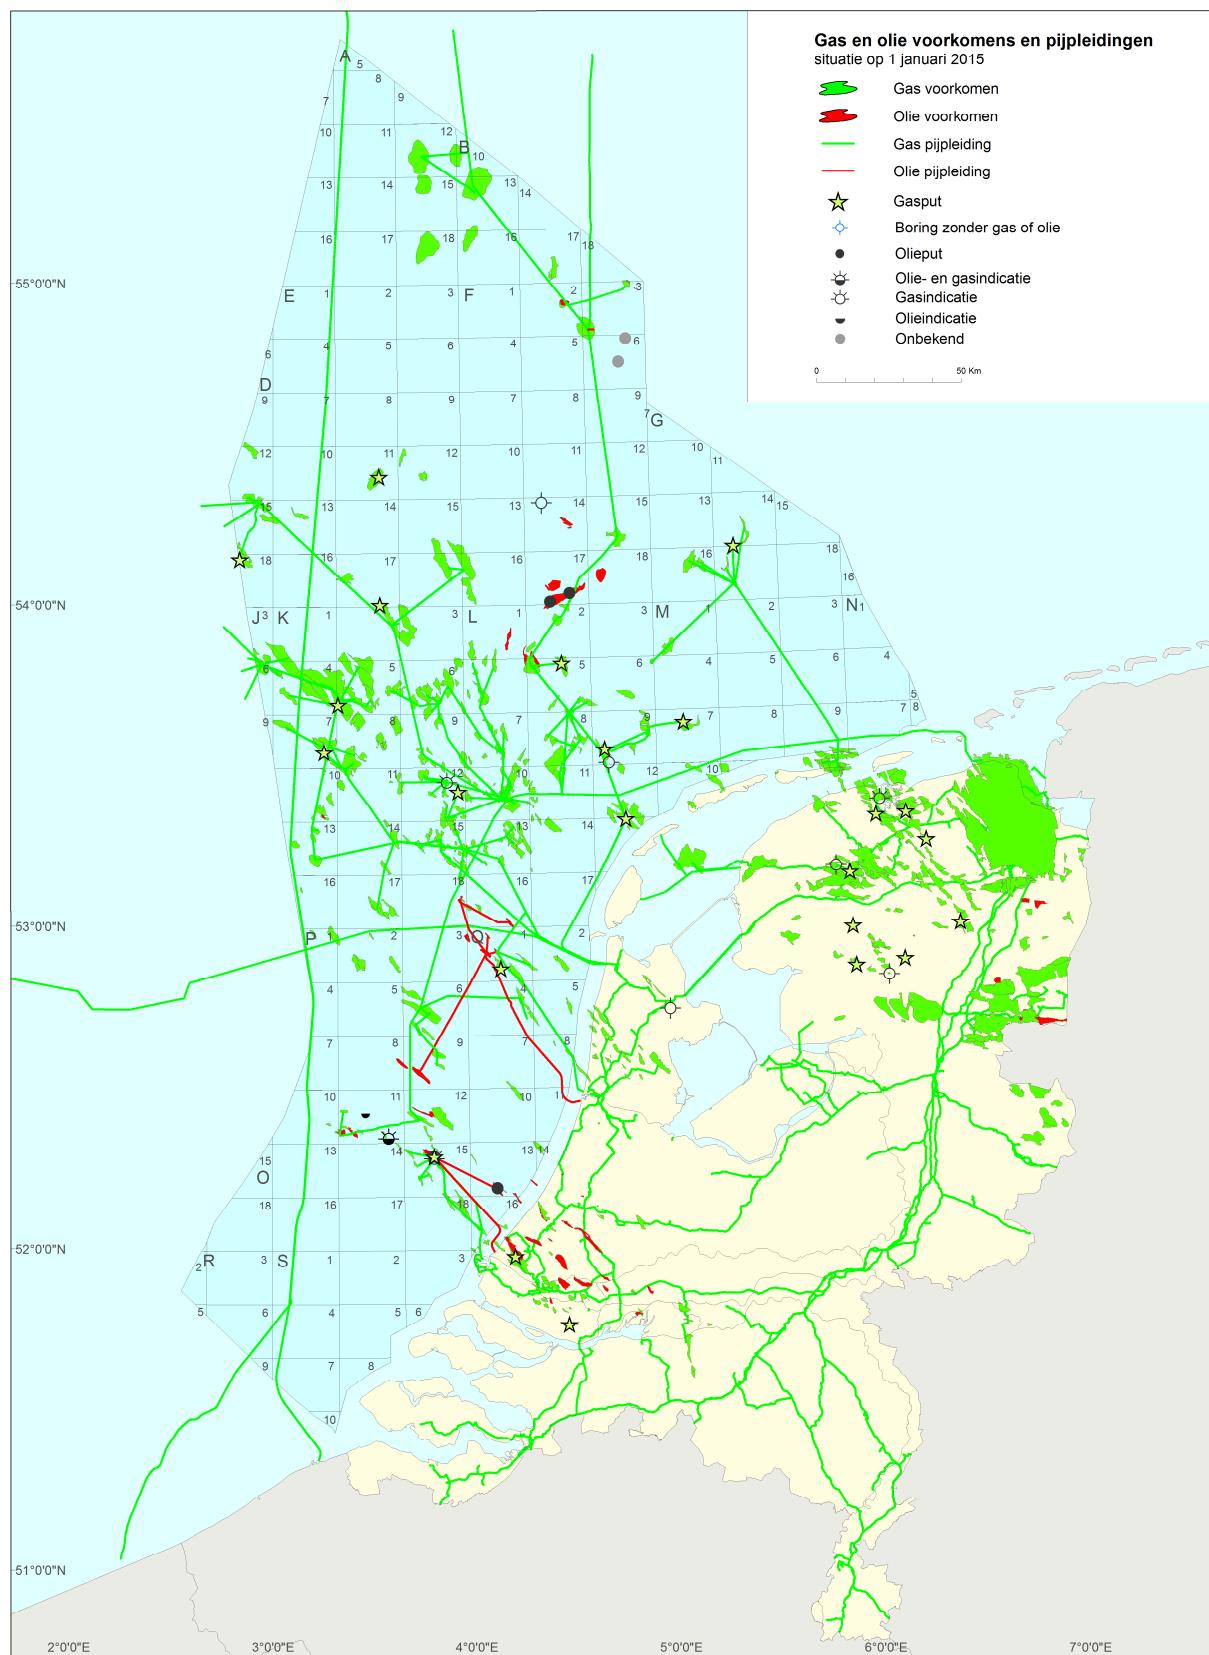

Figure 2. Map showing oil and gas accumulations in the Netherlands (as at 1 January 2015). New discoveries are indicated by asterisks

## New discoveries

The four exploration wells that struck gas seem to have found commercially recoverable volumes (table 5). The locations of the new discoveries are indicated by asterisks in figure 2.

Table 5. Natural gas accumulations discovered in 2014

ep: Exploration License

## Re-evaluation

Operators periodically evaluate the gas fields in technical and economic terms. New developments and insights may lead to revised estimates of the resources. As a result of such re-evaluations of producing and non-producing fields, the estimates of resources were adjusted downwards by 43.9 billion Nm<sup>3</sup> in 2014. The estimate for the Groningen field was adjusted downwards by 20.7 billion Nm<sup>3</sup> (approx. 3% of the remaining reserves), due to re-evaluation of the reserves based on newly acquired data from the production and the new situation which has arisen as a consequence of the seismicity in the Groningen Field. The relatively large adjustment for small fields on the Territory (-30.8 billion Nm<sup>3</sup>) is mostly caused by a re-evaluation and subsequent downgrading of the gas resources. Part of the contingent resources is now waiting for development (on hold). Due to this re-evaluation the chance of development has decreased and as a result these projects are not taken into account for the calculation of the cumulative Netherlands gas resources. On the continental shelf the reserves have increased by 7.6 billion Nm<sup>3</sup> due to upgrade of several projects previously classified as contingent.

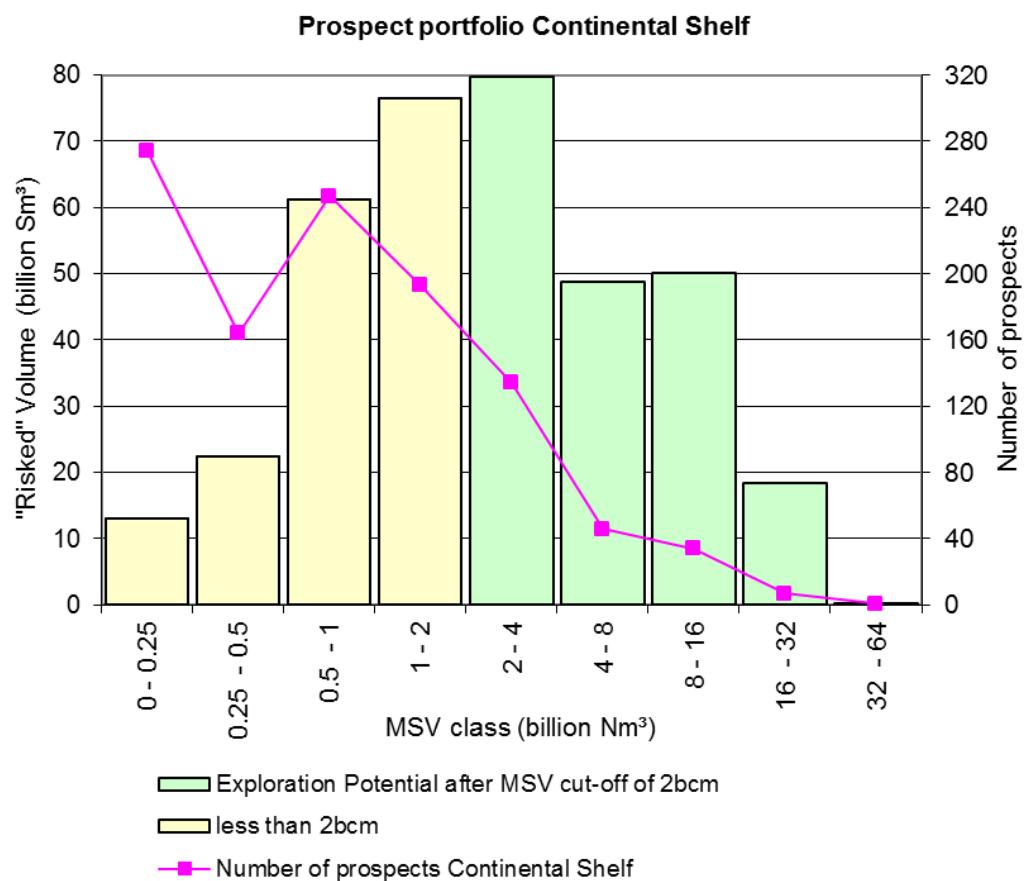

The resources have been adjusted on the basis of production performance and the implementation of technical modifications. The latter include the drilling of new wells and the application of techniques to prolong production, such as compression and the deliquification of production wells. Only these proven techniques have been included. At the moment experiments are being performed with Enhanced Gas Recovery (EGS) in the De Wijk field. Currently this technique is assumed non-proven and the associated resources are therefore not included in the overviews.

## EXPLORATION POTENTIAL

TNO updates the Dutch prospect portfolio for natural gas annually and evaluates the potential for recoverable volume it contains. It does so partly on the basis of figures that operators present in their annual reports for their licensed areas in accordance with article 113 of the Mining Decree. For other areas TNO uses figures from its own database.

### Geological units and prospects

TNO focuses on the evaluation of the so-called 'proven plays'. These are geological units for which the data and discoveries justify the assumption that the necessary geological conditions for the accumulation of natural gas are met. Together, all prospective structures ('prospects') that have been mapped and evaluated on the basis of existing data form the prospect portfolio. Hypothetical plays and prospects are ignored, due to their speculative character.

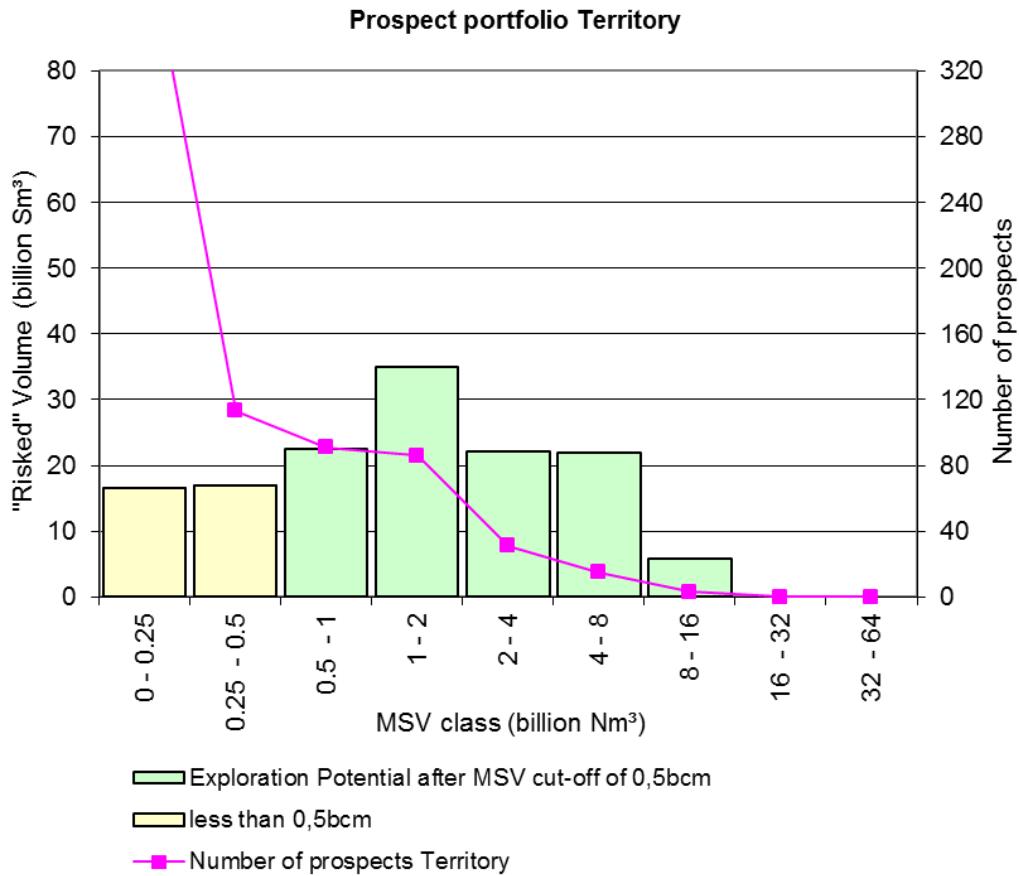

Figure 3. Prospect portfolio characteristics: Number of prospects, in volume classes. Green columns show the exploration potential after applying an MSV lower cut-off (see text for explanation)

### Gas portfolio characteristics

The prospect portfolio is characterised by the number of prospects and the associated volume of gas. The volume of a prospect can be expressed in terms of the expected recoverable volume in the case of a discovery (the so-called Mean Success Volume, MSV), or as the risked volume (the so-called Expectation volume, EXP), which is the product of the MSV and the probability of finding natural gas (the Possibility of Success: POS). The prospect portfolio characteristics as of 1 January 2015 are presented in Figure 3 for Territory and continental shelf. The number of prospects and the cumulative risked volumes are shown per MSV volume class. The total number of prospects in the portfolio is larger than on 1 January 2014. The cumulative risked volume in the 2-4 BCM MSV class is remarkably higher; this can be attributed to an increase in the number of prospects.

However in the Territory the portfolio volume has decreased in all size classes, most likely due to a re-evaluation of the prospects and a resulting lower risked volume. The number of prospects in the portfolio has remained roughly stable.

### Exploration potential

The exploration potential is that part of the prospect portfolio that meets certain minimum conditions. Since the first report on the exploration potential in 1992, a lower cut-off (MSV) has been defined for the expected recoverable volume in the case of discovery. This cut-off is 0.5 billion m<sup>3</sup> for Territory prospects and 2 billion m<sup>3</sup> for continental shelf prospects. The

green columns in figure 3 represent the risked volume of the prospects with an MSV above this cut-off. This volume is called the exploration potential based on the MSV lower cut-off.

The estimate of the exploration potential (see table 6) is expressed as a range, to indicate its inherent uncertainty.

Table 6. Exploration potential for natural gas as at 1 January 2015, after applying the MSV lower cut-off to the prospect portfolio

Area	MSV cut-off [bill. Nm <sup>3</sup> ]	Exploration potential [bill. Nm <sup>3</sup> ]
Territory	0.5	79 – 182
Continental shelf	2	104 – 249

The consequence of a minimum MSV-based lower cut-off is that other factors determining the commercial attractiveness of prospects are not considered. These factors are partly related to individual prospects (possibility of success, distance to infrastructure, type of field development, gas quality, productivity, etc.) and partly to generic factors, in particular the anticipated costs and yields.

An alternative lower cut-off, first presented in the annual review of 2006, requires that for a prospect to be included in the exploration potential the expected net cash value of a project must be positive. A discounted cash flow model takes account of the factors determining the commercial attractiveness of prospects. Using the expected net cash value and taking account of the exploration risk, the Expected Monetary Value (EMV) is calculated for each prospect. The EMV is used to rank the prospects. The possibilities for developing individual prospects are determined using a holistic exploration simulator that takes account of the location of each prospect in relation to distance to infrastructure, probability of success and uncertainty about the volumes. In the bigger picture, the infrastructure of pipelines and the producing fields are considered, in order to realistically evaluate the new resources that are expected to be found. The EMV of each prospect is used to select the most attractive prospects (i.e. those with the highest EMV).

Table 7 shows the expected volume for the exploration potential of prospects with a positive EMV cut-off at a gas price scenario of 21.5 eurocents per m<sup>3</sup>. A comparison with the figures in table 6 reveals that setting the lower cut-off  $EMV > 0$  results in volumes close to the middle of the range of the exploration potential based on the MSV lower cut-off. The increase in the Continental shelf volume as compared to the 1 January 2014 values is caused by the increase in the portfolio (see above), an adaption of the way gas quality is quantified in the model and a structural increase in exploration drilling intensity. However the decrease in the Territory volume is caused by a reevaluation of the portfolio.

Table 7. Exploration potential for natural gas as at 1 January 2015, assuming an economic lower cut-off of  $EMV = €0$  and a gas price of 21.5 eurocents per m<sup>3</sup>

Area	Expected value of exploration potential [billion Nm <sup>3</sup> ]
Territory	113
Continental shelf	165

### **Exploration potential trend/history**

Figure 4 shows the trend in the exploration potential in the Netherlands. The graph for Territory shows a gradual decline from 1996 to 2009 followed by a slight increase continuing to the present, for both the high and the low estimates. Particularly striking in the graph for the continental shelf is the upward trend in the high estimate until about 2004, after which there is a downturn to the level of the 1990s.

Over the course of time, exploration wells have led to some of the exploration potential being transformed into reserves. This can be seen from the increase in cumulative production and remaining reserves (height of the green columns) in figure 4. The exploration potential of 100 billion m<sup>3</sup> for Territory reported in 1992 had already been added to the reserves in 1996. The exploration potential has nonetheless remained stable because of the dynamics in the prospect portfolio on which the estimates are based: Every year, prospects are removed from the portfolio after the drilling of exploration wells, and new prospects are added. Re-evaluations of prospects may also lead to changes in the values of the portfolio (see the paragraph 'Portfolio characteristics').

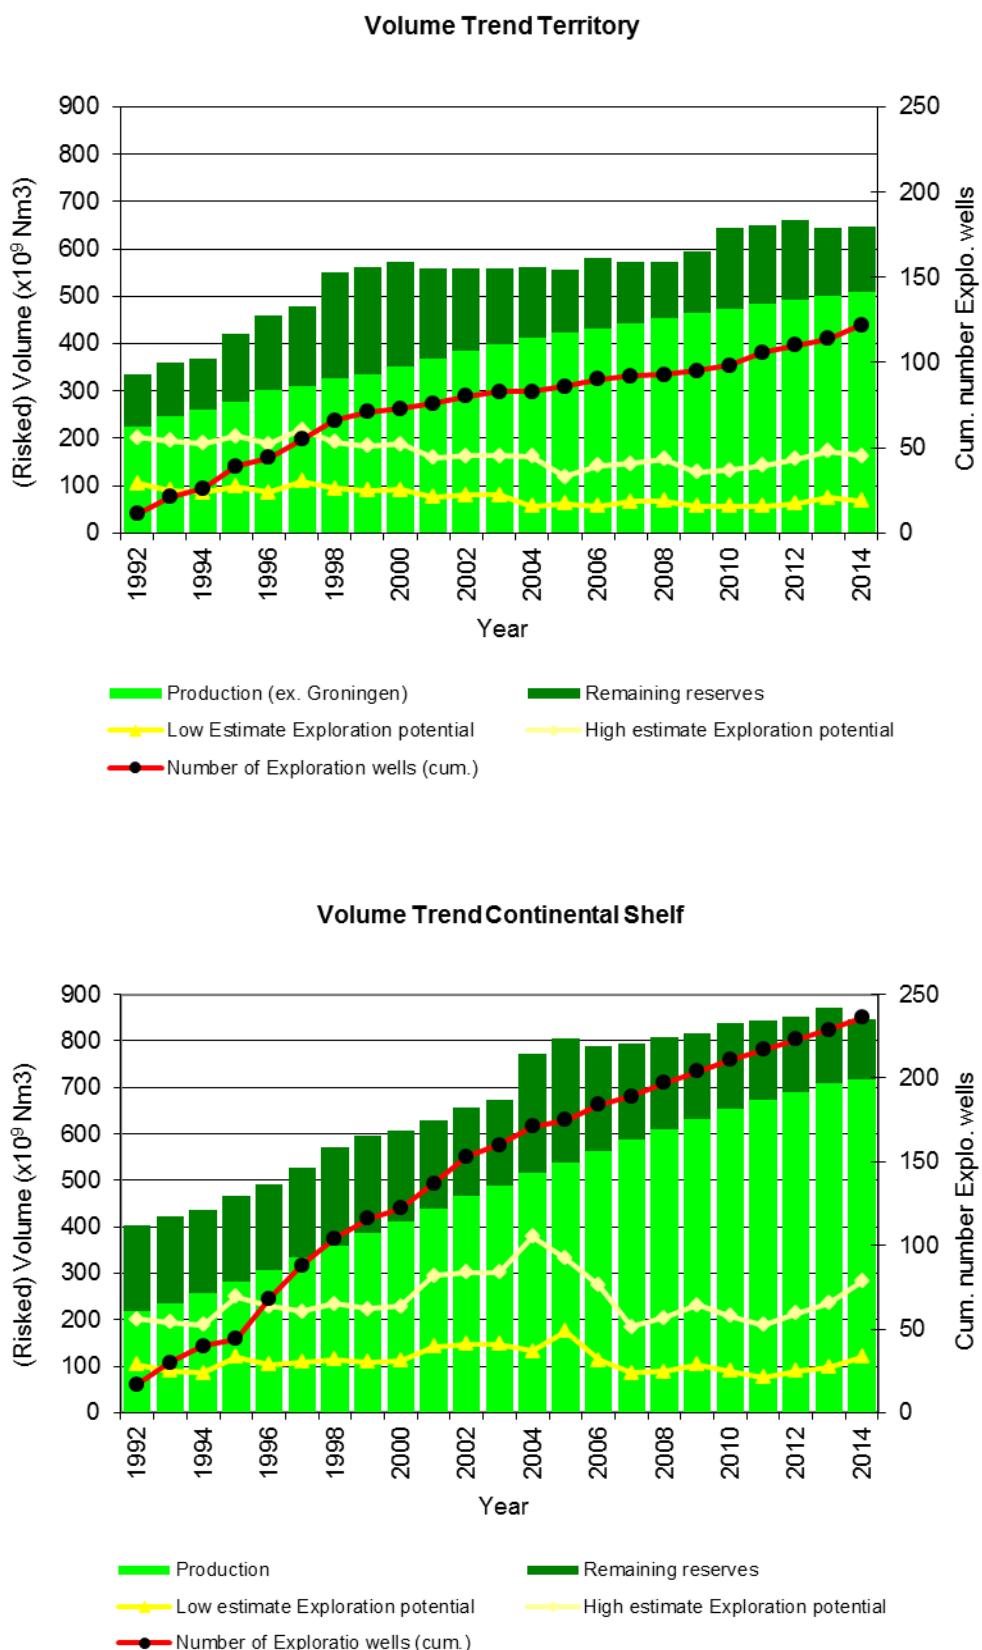

Figure 4. Trends in exploration potential, exploratory drilling, reserves and production 1992–present (excluding the Groningen field)

## **INCENTIVES**

The Decree on investment deduction for marginal gas accumulations on the continental shelf (*Regeling investeringsaftrek marginale gasvoorkomens continentaal plat*) came into force on 16 September 2010 to stimulate the development of marginal gas fields that would otherwise not be drilled. It allows licensees and co-licensees to offset 25 % of the sum they invest in assets for exploring and exploiting a given marginal field or prospect against the result over which they are liable for profit sharing. Applications for marginal fields are reviewed against the following three parameters: technically recoverable volume of gas, initial well productivity and transport distance to a platform.

Since the Decree came into force 46 applications have been filed, of which 28 have been successful. This resulted in 14 new fields being developed in 2014.

At the same time and with the same purpose as the decree, an agreement came into force between the Minister of Economic Affairs and the mining companies active on the continental shelf. This covenant includes a voluntary procedure to stimulate companies holding licences for gas production on the continental shelf to transfer to third parties their fallow concessions (i.e. those that they neither actively exploit nor have concrete plans to bring into production, despite being given the opportunity). Since 1 July 2012, the Minister of Economic Affairs has determined which offshore production licences or parts thereof classify as fallow. The classification is updated annually and is adjusted if, in the interim, this is necessary because new data have become available. The most recent classification is published on NLOG. After a licence area has been declared fallow, the main licensee is notified by the Ministry of Economic Affairs and then has nine months to submit a plan for activities that are deemed significant under the Mining Act. If the main licensee does not make use of this opportunity, the co-licensees are allowed three months to submit their own activity plan. Finally, third parties may then submit their activity plans.

The activity plan for the fallow part of the F3b licence (licensee GDFSUEZ) submitted in 2013 by a third party was published on NLOG in 2014. One competitive application was subsequently received; at the time of compiling this review, both applications were being considered by the Ministry of Economic Affairs. At the end of 2014, third parties submitted an activity plan for the fallow part of the production licence N07b (current licensee is GDFSUEZ). This application was published on NLOG early in 2015. After publication, other operators (excluding the current licensees) have 13 weeks in which to submit a competitive activity plan.

The current status of the production licence s based on the abovementioned covenant can be found at [www.nlog.nl](http://www.nlog.nl). This site also gives the activities in the production licence areas onshore, classified under article 32a of the Mining Act.

## **DOMESTIC SUPPLIES OF NATURAL GAS**

This section of the annual review deals with the expected trend in the supply of Dutch natural gas (domestic production) in the next 25 years (2015 to 2039). Estimates are largely based on data submitted by operators. The reference date for the present review is 1 January 2015. All the volumes are given in billions of m<sup>3</sup> Groningen gas equivalents.

NAM submitted a revised production plan for the Groningen Field to the ministry of Economic Affairs on 29 November 2013. Subsequent discussion on the gas production and related induced seismicity has resulted in postponement of the definite approval for this production plan. On 23 June 2015 parliament has decided to maximize the production over 2015 for the Groningen field to 30 billion Nm<sup>3</sup>. The underground gas storage in Norg can (for one time only) supply an additional 3 billion Nm<sup>3</sup>. Also an additional 2 billion Nm<sup>3</sup> of Groningen gas has been designated as a buffer to maintain security of supply in case of technical issues. This buffer will only be used in case technical issues do arise. So as not to make assumptions on decisions for future policy the production prognosis for the Groningen Field is not provided after 2015 in this annual review. The estimated supply for the next 25 years (2015 to 2039) is restricted to the small fields and as yet undiscovered accumulations (exploration potential). In addition to the estimated future production figure 5 also provides the actual natural gas production in the Netherlands for the period 2005-2014. 92% of the prognosed production from the small fields for the year 2014 was actually realised.

The estimated domestic production from the small fields is based on the following:

- The summation of the profiled **reserves** and **contingent resources from the subclass 'development pending'**. These profiles have been provided by the gas producers in their annual reports (in accordance with article 113 of the Mining Decree).
- The summation of the simulated production profiles of **as yet undiscovered accumulations**. These profiles have been prepared using a simulation model that takes into account the number of wells expected to be drilled (11 exploration wells per year and a minimum risked value to investment ratio (RVIR) of 0.1), the expected recoverable volumes of the prospects, the expected productivity of the well and the possibility of success.

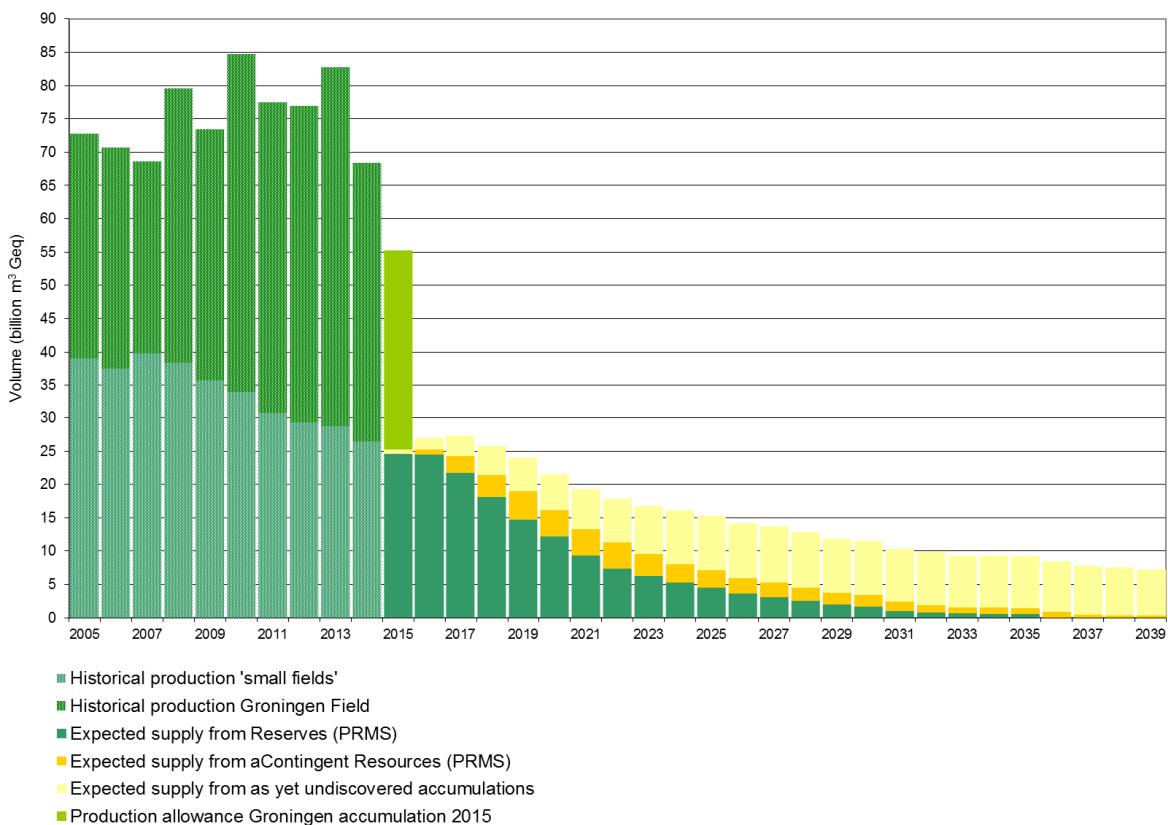

Figure 5. Actual production of natural gas in the Netherlands from 2001 - 2015 and production prognosis for the period 2015 - 2039.

### Total domestic production from small fields and the exploration potential

Production from the small fields is estimated at 24 billion m<sup>3</sup>Geq for 2015, but will gradually decrease to seven billion m<sup>3</sup>Geq in 2039. The total estimated domestic production from the small fields will be 380 billion m<sup>3</sup>Geq over the next 25 years (Table 8).

Table 8. Domestic production of natural gas from small fields for the next 10 and 25 years, in billion m<sup>3</sup>Geq

Production	2015 to 2025	2015 to 2039
Small fields		
Reserves	144	166
Contingent resources (dev. pending)	29	48
As yet undiscovered	48	166
Total for small fields	221	380

## 2. OIL RESOURCES

On 1 January 2015 there were 48 proven oil accumulations in the Netherlands, 15 of which were producing. All oilfields are listed in summary annex 1, sorted by status and stating operator and licence.

Table 9. Number of proven oil accumulations as at 1 January 2015

Status of oil accumulation	Territory	Continental shelf	Total
<b>I. Developed</b>			
a. Producing	3	12	15
<b>II. Undeveloped</b>			
a. Production to start 2015-2019	0	4	4
b. Other	10	10	20
<b>III. Production</b>			
a. Ceased	0	0	0
b. Abandoned	9	0	9
<b>Total</b>	22	26	48

NP>5: Undeveloped field, no known date of start of production

U: Production terminated

A: Abandoned

## **Oil resources as at 1 January 2015**

The resource estimates for developed fields are based on the figures and information submitted by the operators in accordance with the Mining Act. Here, the reserves are reported (i.e. that part of the resources that can be produced commercially and has been qualified as such by the operators) and also the contingent resources ('production pending' – that part of the resources that may be reasonably be assumed to be commercially recoverable, but which do not yet meet all the criteria for classification as such). As the resource classification is project-based, reserves and contingent resources may both be present within one accumulation.

Table 11. Oil resources in million Sm<sup>3</sup> as at 1 January 2015

Area	Reserves	Contingent resources (development pending)	Total
Territory	18.2	9.6	27.8
Continental shelf	4.1	2.8	6.9
Total	22.4	12.4	34.7

The total oil resources are 34.7 million Sm<sup>3</sup>: 22.4 million Sm<sup>3</sup> oil reserves plus 12.4 million Sm<sup>3</sup> contingent resources.

## **Revised estimates of the oil reserves compared with 1 January 2014**

Table 12 shows the adjustments made to the Dutch oil resources as a result of:

- Re-evaluations of previously proven accumulations
- Production during 2014.

The decrease in oil resources on the continental shelf is mainly the result of depreciation of the contingent resources, caused in turn mainly by the low oil price. By downgrading these projects, they are not counted in this review. The net result is a decrease of the oil resource by 12.4 million Sm<sup>3</sup> compared with 1 January 2014.

Finally, oil production in 2014 accounted for 1.8 million Sm<sup>3</sup> of the decline in the resources.

Table 12. Revised estimates of oil resources compared with 1 January 2014, in million Sm<sup>3</sup>

Area	Change as a result of:		Total
	Re-evaluation	Production	
Territory	-8.2	-0.7	-8.8
Continental shelf	-2.4	-1.1	3.5
Total	-10.6	-1.8	-12.4

Figure 6 shows oil production since 2005 and the prognosis for the next 25 years. This prognosis is based on the annual reports of the operators. Compared to last year's forecast, the production has lagged behind expected production slightly. However the expected production for the next 25 years has not changed significantly. The slight increase in

production is caused mainly by the start of production in the Q13a-Amstel field. Also the expected initiation of production in several projects around 2019 is clearly visible in Figure 6, this was not reported in previous annual reviews. An example of one of these projects, barring already producing fields, is the L5-b field.

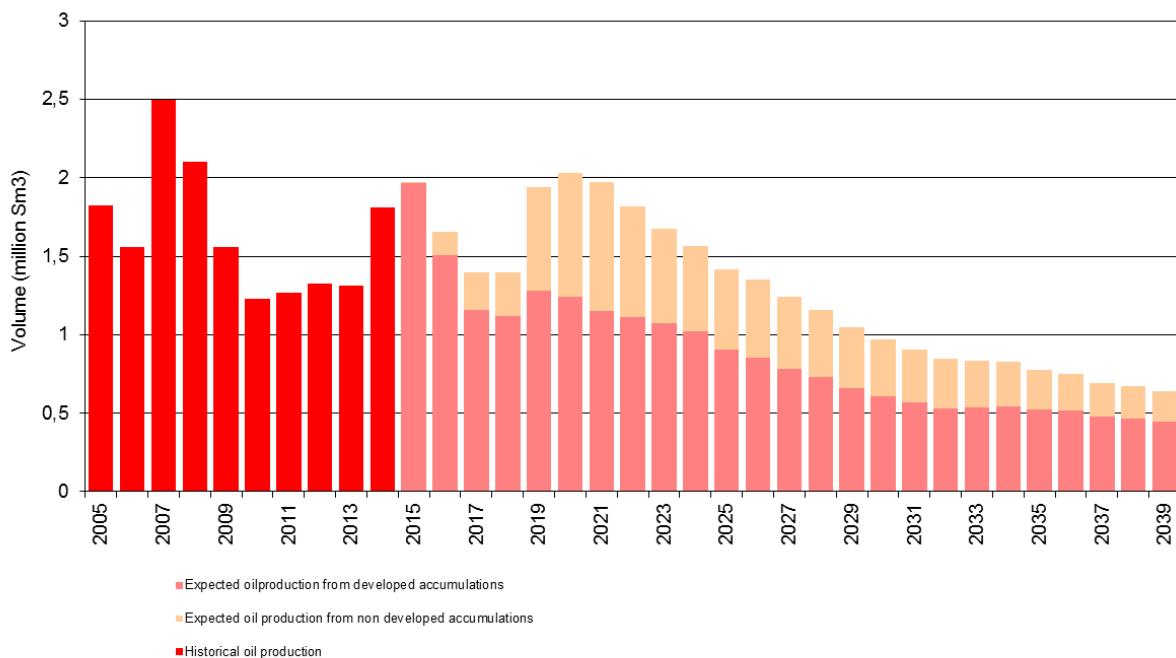

Figure 6. Historical oil production and prognosis for production until 2039

### 3. HYDROCARBON LICENCES, changes in 2014 Netherlands Territory

Changes which took place during 2014 and concerned licences for hydrocarbon exploration and production onshore are listed in the tables below, together with all ongoing applications for licences.

Total area	Under licence
41 785 km <sup>2</sup>	21 337 km <sup>2</sup> (51.06%)

## 7. OIL AND GAS WELLS COMPLETED IN 2014

The wells completed in 2014 have been grouped according to drilling location (on Netherlands Territory or on the continental shelf) and then according to whether they are exploration, appraisal, or production wells. An overview of other wells (for the injection of gas, steam or water) is also presented. The final table is an aggregated overview of the drilling activities in 2014. Eight of the 18 exploration wells encountered gas (and one of these also encountered oil). This is a success rate of 44%. The four appraisal wells (all on the continental shelf) confirmed accumulations discovered earlier. Eighteen production wells were drilled in 2014.

Ten wells were drilled to develop the Bergermeer and Norg gas storage facilities and three were drilled for the injection of steam or water.

### TERRITORY

#### Exploration wells

	Name of well	Licence	Operator	Result
1	Anjum-06	Noord-Friesland	Nam	Gas shows
2	Diever-02	Drenthe IIb	Vermillion	Gas
3	Hempens-01	Leeuwarden	Vermillion	Dry
4	Havelte-01	Steenwijk	Vermillion	Dry
5	Lambertschaag-02	Slootdorp	Vermillion	Dry
6	Langezwaag-02	Gorredijk	Vermillion	Gas

## **8. PLATFORMS AND PIPELINES, Netherlands continental shelf**

In 2014 one new platform was installed on the continental shelf and two were removed. One new pipeline was laid.

For a complete list of platforms and pipelines, see annexes 16 and 17. The pipeline data was supplied by State Supervision of Mines (*Staatstoezicht op de Mijnen*).

### **Platforms installed in 2014**

## **9. PRODUCTION OF GAS AND OIL**

The tables below list the aggregated production figures for natural gas, oil and condensate for 2014. Condensate is considered to be a by-product of oil or gas production. Changes compared with 2013 are given in absolute figures and as percentages. The information in the tables is based on figures supplied by the operators.

The fall in gas production compared with 2013 is largely attributable to production from the Groningen field being reduced at the request of the Minister of Economic Affairs in order to reduce the risk of earthquakes in the region. The decline in production from the small gas fields reflects the gradual depletion of the producing fields, particularly those on the continental shelf. The increase in oil production is largely the result of the Q13 Amstel field coming on stream, 42 years after being discovered.

In 2014 the following fields came on stream or stopped producing.

<b>Production start</b>	<b>Field</b>	<b>Producing</b>	<b>Year discovered</b>
November 2014	P15-19A4	Gas	2014
April 2014	Burum-Oost	Gas	2013
March 2014	K07-FE	Gas	2000*
June 2014	Oudendijk	Gas	2014
April 2014	Q16-Maas	Gas	2011
April 2014	Heinenoord	Gas	2011
March 2014	Q01-D	Gas	2008
February 2014	Q13a-Amstel	Oil	1962

\* production resumed

<b>Production ceased</b>	<b>Field</b>	<b>Producing</b>	<b>Year discovered</b>
December 2014	Andel-6 (Wijk & Aalburg)	Gas	1991

**Overview of natural gas, oil and condensate production in 2014 and the changes compared with 2013**

### Natural gas production from small fields on Netherlands Territory, per stratigraphic reservoir

The bar graphs below show the contribution of each stratigraphic reservoir level to the total gas production from the small onshore fields. Production from fields with multiple reservoir levels is depicted by hatched shading. The Groningen field (excluded from this overview) lies in the Rotliegend reservoir. The first bar graph shows that the biggest contribution to the gas production from the small fields is from the Rotliegend and Triassic reservoirs. The steep decline in production (by about 10% annually) during the period 2003 – 2006 was halted in 2007, largely thanks to gas production from under the Wadden Sea. Since then, there has been a general decline of about 5% per annum. However, in 2013 there was an upturn, largely thanks to production from Rotliegend fields. The second bar graph shows production excluding that from the Rotliegend and Triassic reservoirs. This reveals the contribution from the Cretaceous, Zechstein and Carboniferous reservoirs to the gas production. (Note that onshore there is no production from Jurassic reservoirs). Production from these reservoirs declined steadily in previous years but as a whole levelled out the last couple of years.

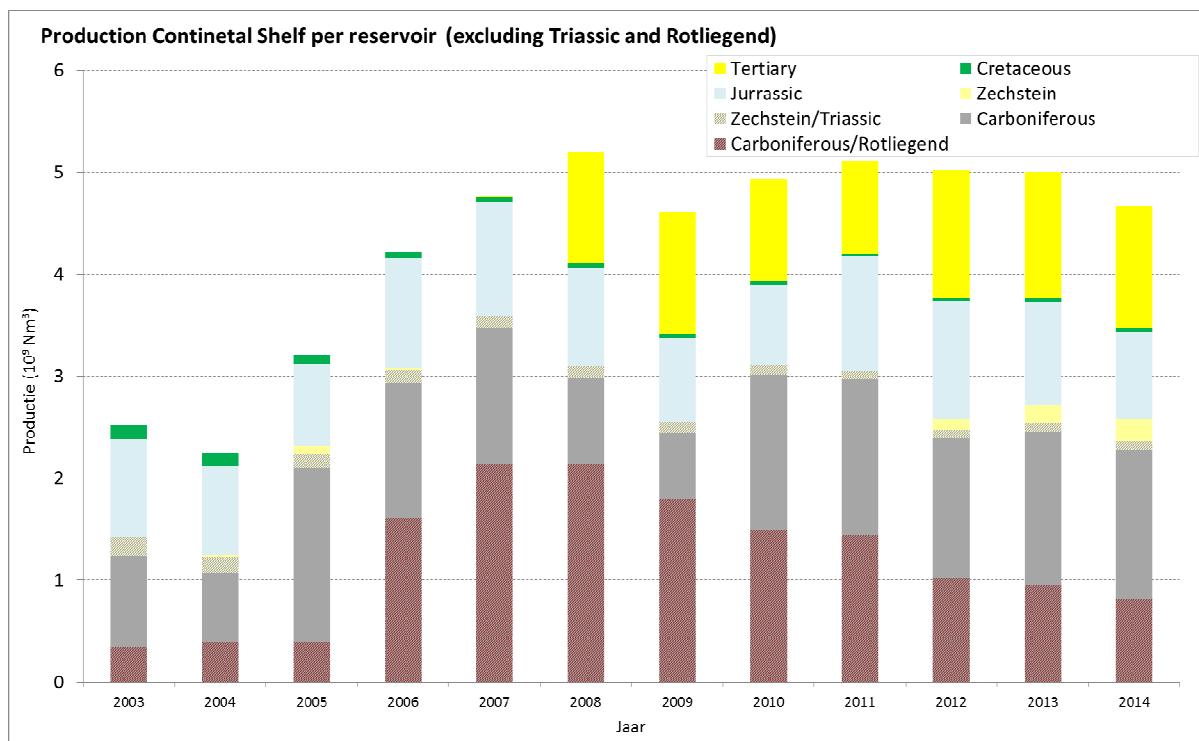

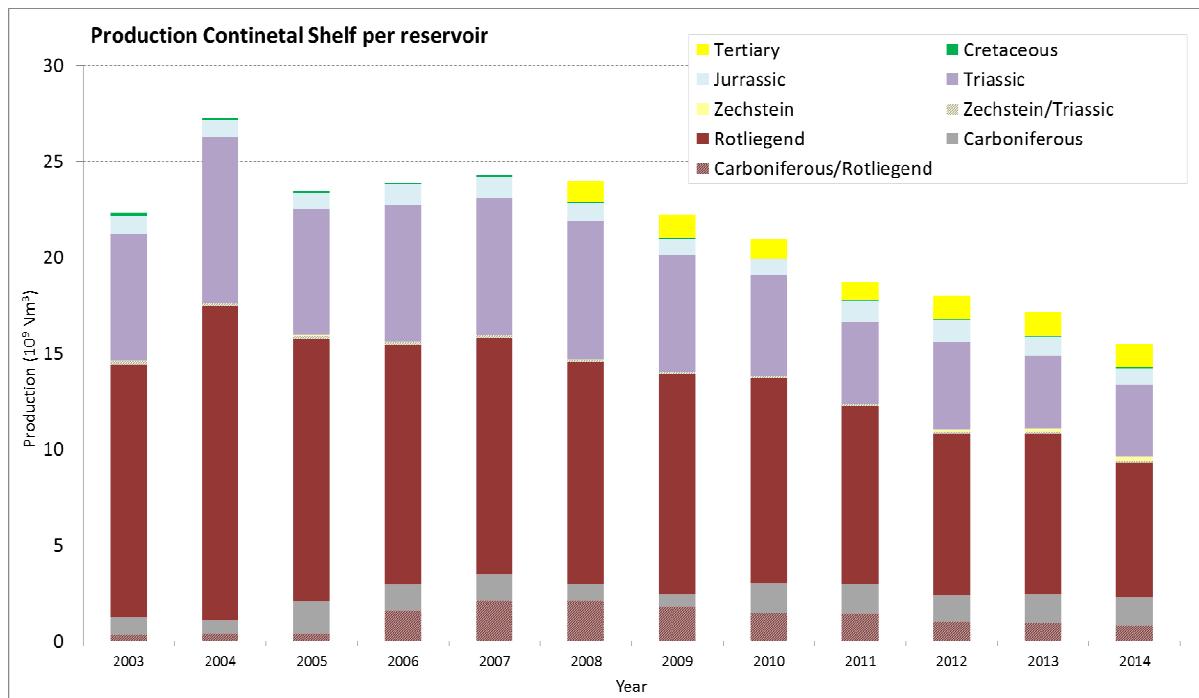

## PRODUCTION OF NATURAL GAS, Continental shelf in 2014 (in million Nm<sup>3</sup> | )

The production per licence is the total production of all producing wells with a wellhead within the licence area. Production data are supplied by the operating companies.

**Gas production, Netherlands continental shelf per stratigraphic reservoir** The two bar graphs below show the contribution of the gas reservoirs to gas production from the continental shelf. From the first graph it can be seen that on the continental shelf (just as onshore) the biggest contribution to the gas production is from the Rotliegend and Triassic reservoirs. Production was fairly constant from 2003–2008, but thereafter declined steadily, with 2012 being the first year in which offshore production fell below 20 billion Sm<sup>3</sup>/year. The second graph shows production excluding that from the Rotliegend and Triassic reservoirs, in order that the contribution from reservoirs at other levels can more clearly be seen. During the period 2005–2007 the contribution from fields with combined Carboniferous–Rotliegend reservoirs almost tripled, but since 2008 production from this reservoir level has again been declining steadily. The start of production from the shallow (Tertiary) reservoirs in the northern part of the Dutch continental shelf in 2008 is striking. Production from the Tertiary reservoirs has remained fairly stable, thanks to B13-A coming on stream.

## OIL PRODUCTION in 2014 (in 1000 Sm<sup>3</sup>)

The production per licence is the total production from all producing wells with a wellhead within the licence area. Production data are supplied by the operating companies.

\* Condensate is also referred to as natural gasoline or natural gas liquids (NGL).

## **10. UNDERGROUND STORAGE**

In 2014 one storage licence has been applied for. This concerns the storage of filling material to stabilise a salt cavern. In 2014 there was one mutation in the companies holding licences.

On 1 January 2015 11 storage licences were in force: five for underground storage of natural gas (Alkmaar, Bergermeer, Grijpskerk, Norg and Zuidwending), two for nitrogen (Winschoten II and Winschoten III), one for gas oil (Twenthe - Rijn De Marssteden), two for saline water and one for storing CO<sub>2</sub>.

A map of all storage licences as at 1 January 2015 is given in annex 1.

### **STORAGE LICENCES, Netherlands Territory**

#### **Changes in 2014**

## **11.COAL**

No coal has been mined in the Netherlands since 1974. By then, almost 570 million tonnes of coal had been mined. Conventional mining is not expected to become profitable again in the future but interest has been shown in producing coal bed methane (CBM). Although research has indicated that a large resource of CBM may be present in the coal seams, the economic feasibility of recovering it has not yet been demonstrated.

On 1 January 2015 there were five production licences for coal in force. In 2014 there were again no mining activities in the licence areas. A map showing the location of the production licence areas is presented in appendix 6.

### **PRODUCTION LICENCES, Netherlands Territory, on 1 January 2015**

<b>Licensee</b>	<b>Licence</b>	<b>Effective from</b>	<b>km<sup>2</sup></b>

Total			284

## 12. ROCK SALT

Changes which took place during 2014 in relation to licences for the exploration and mining of salt are listed in the tables below, together with all ongoing applications for licences. In addition, monthly salt production per location is given, as well as an overview of annual production since 2003.

In 2014 one application for an exploration licence, submitted the previous year, was still ongoing and one production licence was awarded for rock salt production. In 2014 there was one change of company in one licence.

On 1 January 2015 16 production licences were in force, all for areas in the north and east of the country, which is where the salt is found (in Zechstein and Triassic deposits).

See appendix 6 for a map showing the location of the production licence areas.

## 13. GEOTHERMAL ENERGY

A large number of changes in exploration licences for geothermal energy took place in 2014:

- two licence applications
- six licences were awarded
- two licences were rejected.
- two licences were split,
- one licence was merged
- three licences were restricted.
- twenty eight licences were extended
- eight licences expired, or were either withdrawn or relinquished.

In 2014 there were no new applications for production licences for geothermal energy. One geothermal energy production licence was issued. Changes which took place during 2014 in relation to licences for the exploration and production of geothermal energy are listed in the tables at the end of this chapter.

### Geothermal wells and production installations

In 2014 five geothermal wells were completed (see table **Error! Reference source not found.** below). They were drilled in the licence areas Heemskerk, De Lier and Middenmeer. Realising these wells increased the geothermal production installations in the Netherlands in 2014 by three (Figure 7). These installations are named doublets as they consist of two wells. One well pumps up the warm water and after extracting the heat, the second well injects the cooled down water back into the aquifer.

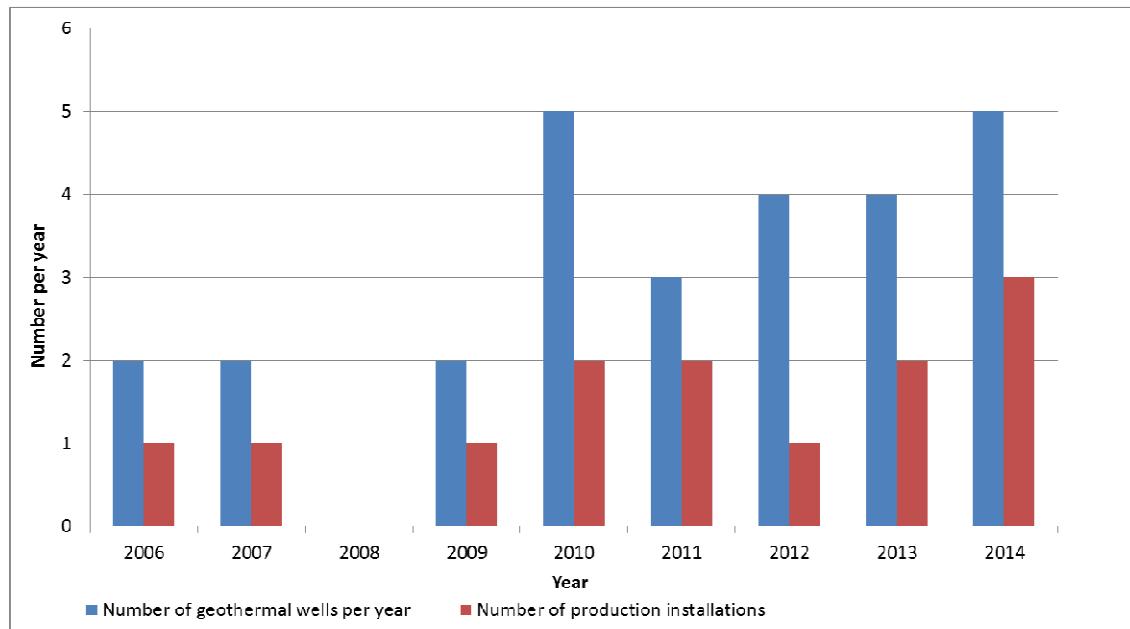

Figure 7. Number of geothermal wells completed per calendar year and number of installations completed since 2006

Table 13: Geothermal energy wells completed in 2014

	Name of well	Geothermal energy licence	Operator
1	Heemskerk-GT-02	Heemskerk	Ce-Ren Beheer B.V.
2	De Lier-GT-01	De Lier	VOF Geothermie De Lier
3	De Lier-GT-02	De Lier	VOF Geothermie De Lier
4	Middenmeer-GT-03-S1	Middenmeer	ECW Geoholding B.V.
5	Middenmeer-GT-04	Middenmeer	ECW Geoholding B.V.

### Production of geothermal energy as at 1<sup>st</sup> January 2015

As at 1<sup>st</sup> January 2015 there were a total of 13 geothermal installations. Although the installation of Heerlerheide (wells 1 & 2) is classed under mining legislation as being for geothermal energy it actually is a heat/cold storage facility and as such will not be included in the following tables. Of the other 12 geothermal doublets ten were operational in 2014. Of the two remaining installations one was in the start up phase while the other was temporarily closed in.

Table 14: Geothermal installations.

Name of geothermal energy installation	Wells	Geothermal energy licence	Operational in 2014
Californie Geothermie	CAL-GT-1,2&3	Californie I	Yes
De Lier Geothermie	LIR-GT-1&2	De Lier	Yes
Honselersdijk Geothermie	HON-GT-1&2	Honselersdijk	Yes
Berkel & Rodenrijs	VDB-GT-3&4	Bleiswijk 1b	Yes
Bleiswijk	VDB-GT-1&2	Bleiswijk	Yes
Koekoekspolder Geothermie	KKP-GT-1&2	Kampen	Yes
Mijnwater energiecentrale Heerlen	HLH-G-1&2	Heerlen	Yes, heat/cold storage
Pijnacker-Nootdorp Geothermie	PNA-GT-1&2	Pijnacker-Nootdorp 4	Yes
Pijnacker-Nootdorp Zuid Geothermie	PNA-GT-3&4	Pijnacker-Nootdorp 5	Yes
-	HAG-GT-1&2	Den Haag	Closed in
-	HEK-GT-1&2	Heemskerk	No
Middenmeer Geothermie I	MDM-GT-1&2	Middenmeer	Yes
Middenmeer Geothermie II	MDM-GT-3&4	Middenmeer	Yes

Figure 8 shows the aggregate production of geothermal energy per month in tera joules (TJ) and also the number of installations contributing to the monthly total. Not all installations were operational throughout the year.

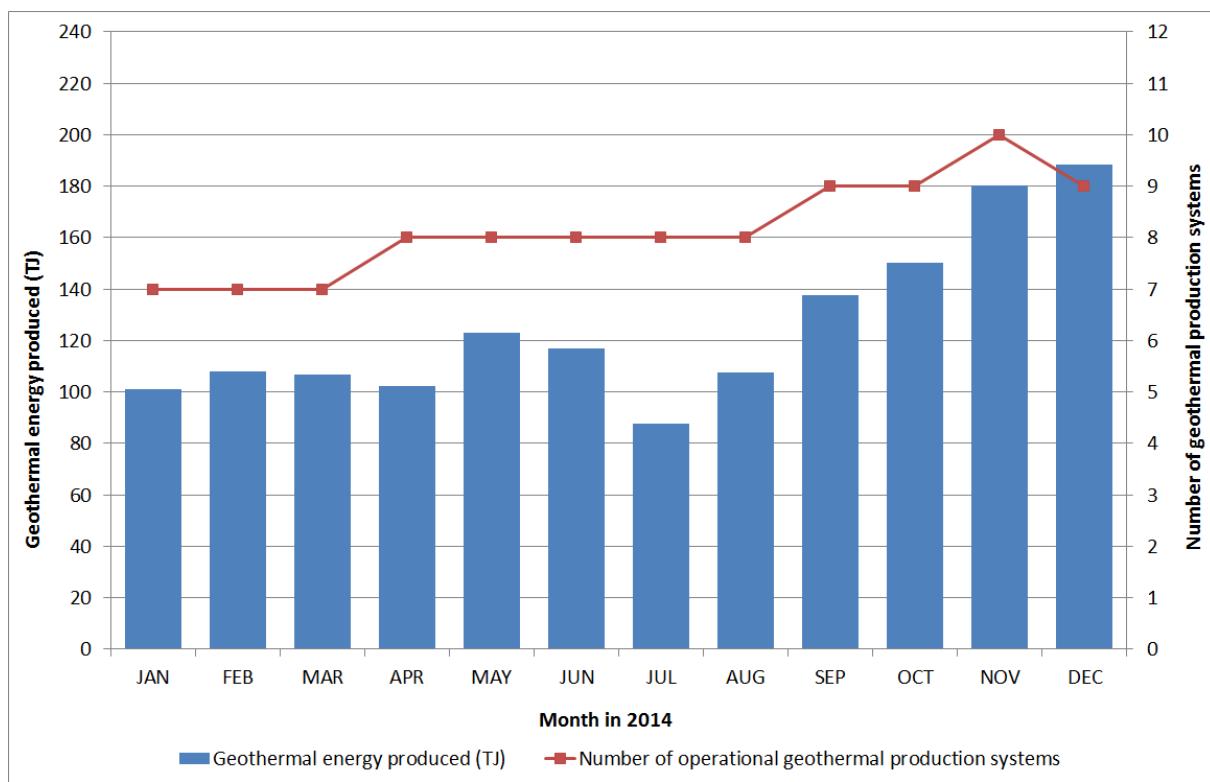

Figure 8. Monthly production of geothermal energy in tera joules and the number of geothermal energy production systems contributing to the reported production (excluding Heerlen mine water power station)

The cumulative reported annual production steadily grew since the beginning of 2008 to 1509 TJ in 2014 (Table 15, Figure 9). Small amounts of hydrocarbons are co-produced with the geothermal energy. In most installations the hydrocarbon is gas, but in one installation oil is produced as well. The gas is usually dissolved in the formation water and released when the pressure of the production water in the production installation falls below the ‘bubble point’. Five installations reported the volumes of gas captured (Figure 10). In the remaining installations no gas or oil was captured.

Table 15: Annual production of energy and co-produced hydrocarbons

Year	Energy produced (TJ)	Co-produced gas (x1000Nm <sup>3</sup> )	Co-produced oil (Sm <sup>3</sup> )
2008	96*	-	-
2009	142*	-	-
2010	318*	-	-
2011	316*	-	-
2012	495*	-	-
2013	993*	-	-
2014	1509	3267**	429

\*Figure derived from: *Hernieuwbare energie in Nederland 2013*. Statistics Netherlands, The Hague/Heerlen, 2014. ISBN: 978-90-357-1857-9

\*\* Not yet fully reported

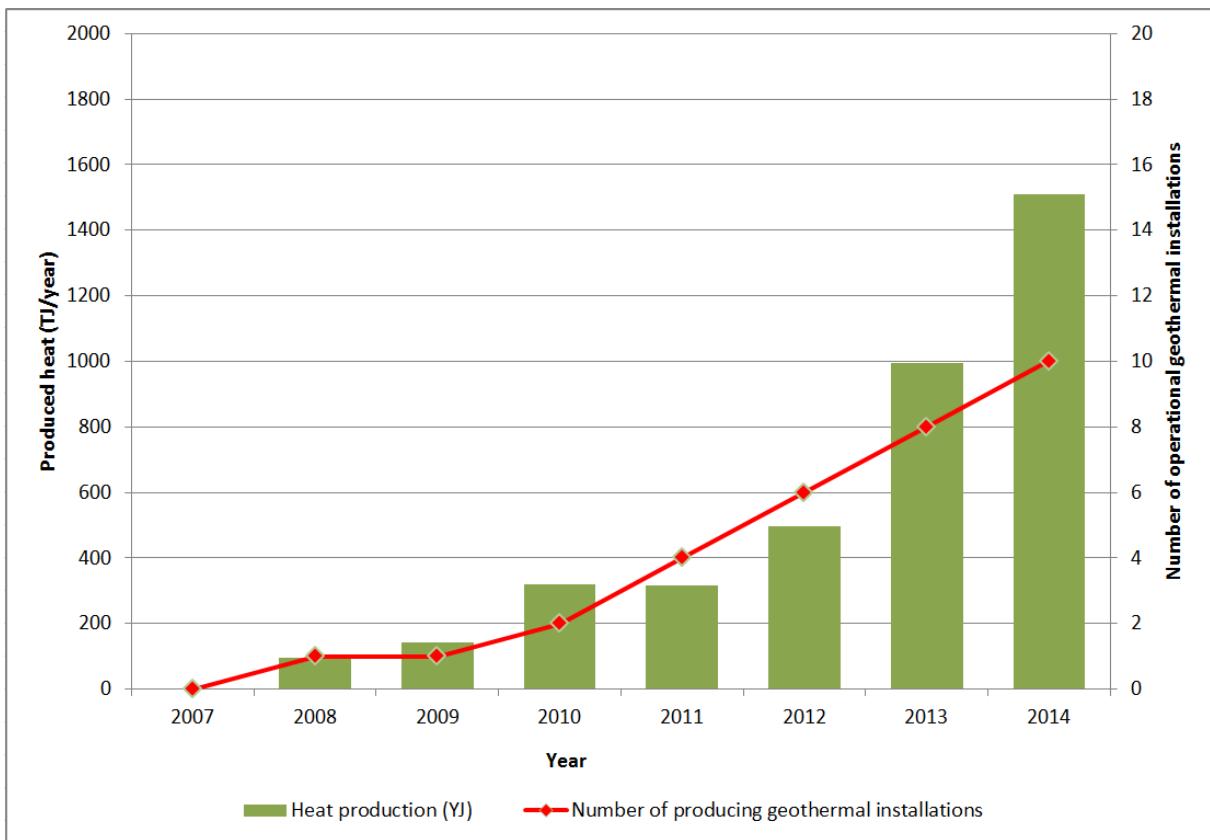

Figure 9. Annual production of geothermal energy (TJ/year)

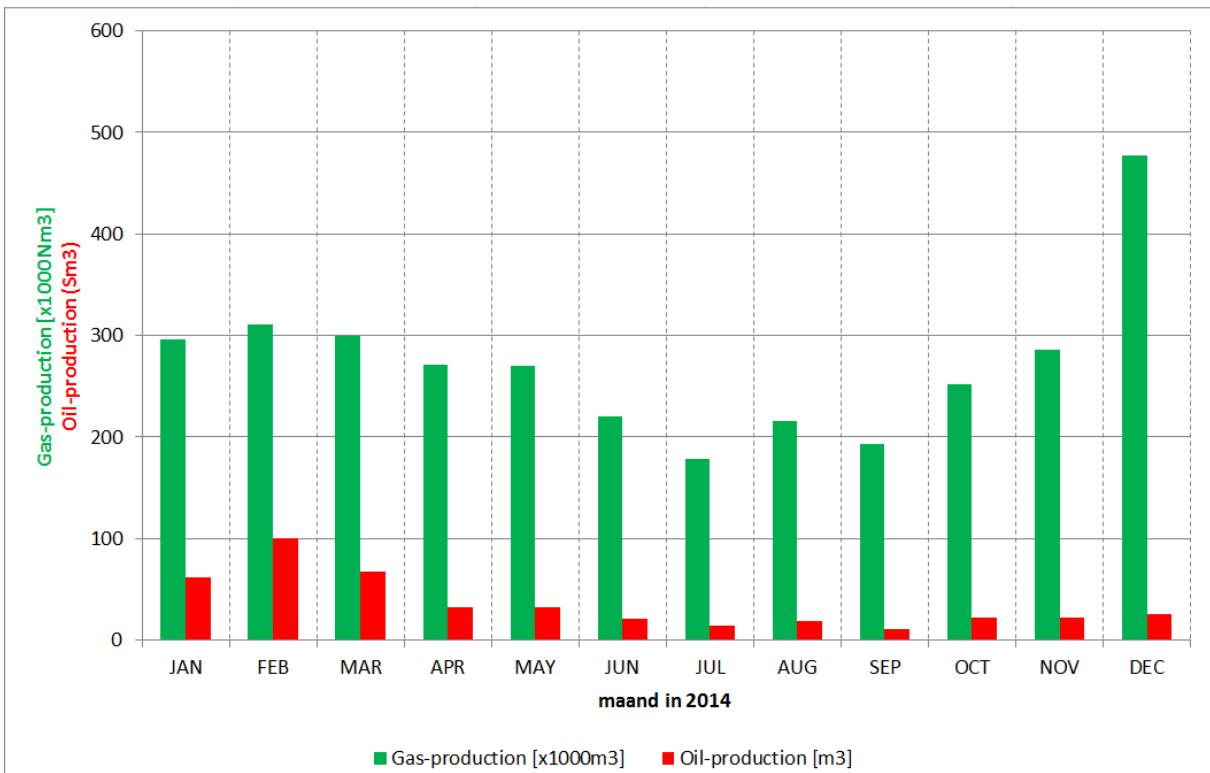

Figure 10. Volumes of hydrocarbons co-produced with geothermal energy. Gas in 1000Nm<sup>3</sup> and oil in Sm<sup>3</sup>. 1 installation has not yet reported co-produced gas over the entire year.

The heat is produced from different depth intervals. (Figure 11a) and from strata in various geological units. (Figure 11b). Most of the geothermal energy is produced from rocks in the Upper-Jurassic and Lower-Cretaceous; these installations are located in the southwest of the Netherlands. The three production installations in Noord-Holland and Overijssel produce from Rotliegend strata, whereas the installation in north Limburg produces from Lower Carboniferous strata.

The heat produced by the installations is mainly used to heat commercial greenhouses. One project also supplies heat to a utility company and an urban area. Another project intends to supply heat to a heating network in an urban area (Figure 11c).

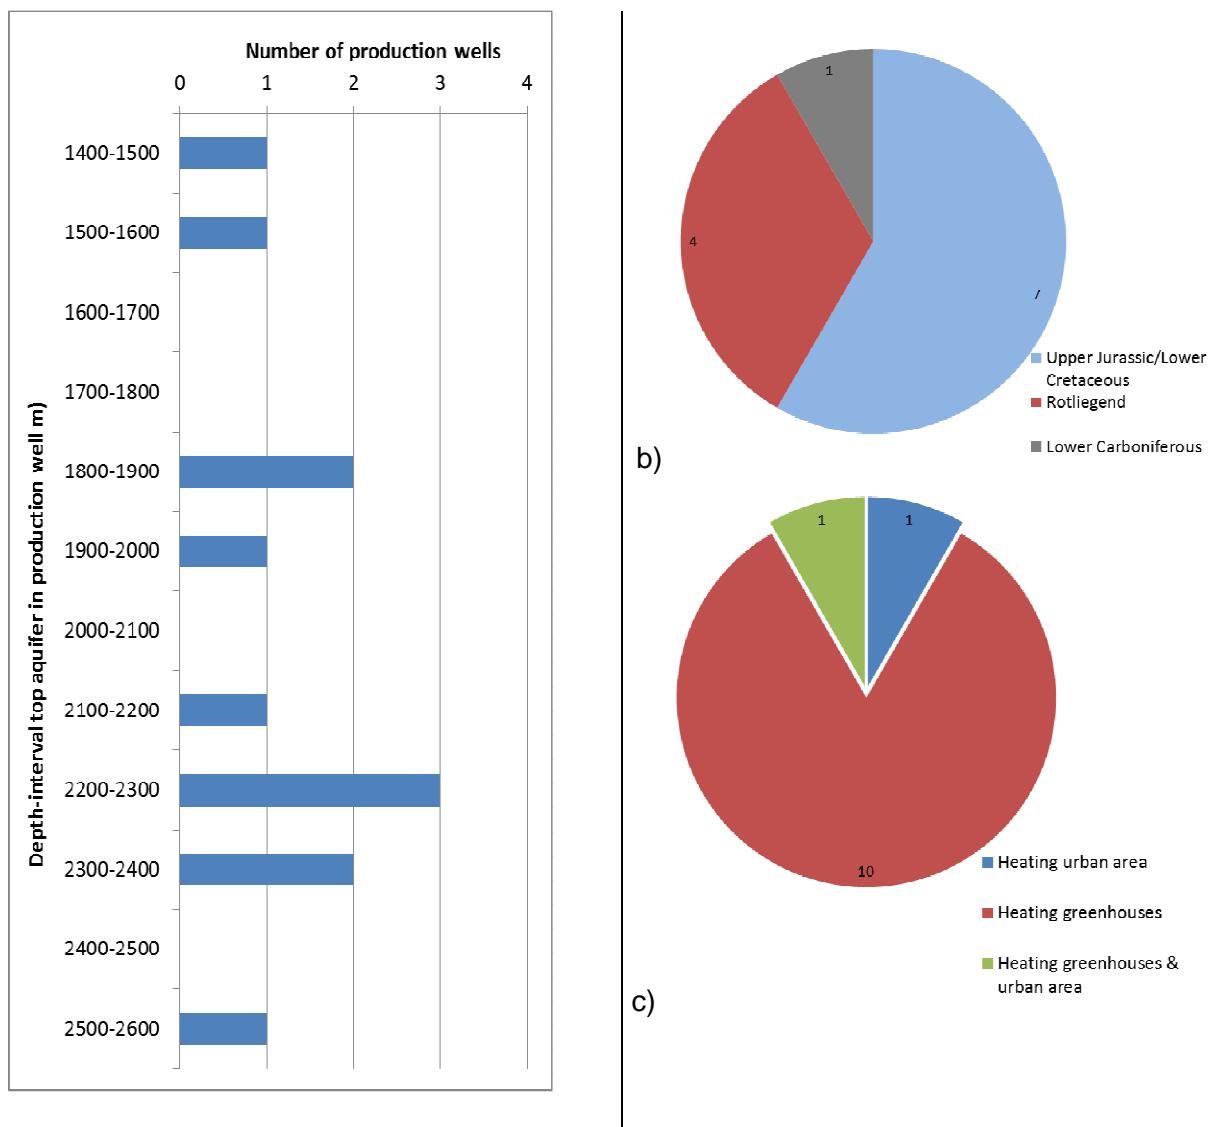

Figure 11. a) Depth to top of aquifer, b) Stratigraphy of the productive interval, c) uses of the heat produced

### **Production licences**

Two producing installations operate under a formal production licence (excluding the Heerlerheide installation) the remaining eight geothermal installations produce as an 'extended well test'. During this test period the licensee will gather data to enable an efficient operation for future times. At the end of 2014 all but two producing operators had applied for a proper production licence and had submitted a production plan.

18	7.35	1.00	8.35
19	6.95	1.00	7.95

The revenues presented here are transaction-based, i.e. they have been allocated to the year in which the production that yielded the revenue took place. (By contrast, revenue recorded on a cash basis is recorded at the time the State actually receives the revenue, which is some time later than the transaction-based revenue).

Non-tax revenue comprises bonus, surface rights, royalties, the State profit shares, the special payments to the State on production from the Groningen field and the profit paid out by EBN B.V. (the State participant in the production).

Tax income for the years 2015 until the end of May 2019 is anticipated based on the expected price at gas trading hubs such as TTF. The TTF price per Sm<sup>3</sup> gas used to calculate the estimates rises from 21 euro cents in 2015 to 23 euro cents in 2019.

Netherlands Oil and Gas Portal,

[www.nlog.nl](http://www.nlog.nl)

The Netherlands Oil and Gas Portal provides information about mineral resources and geothermal energy in Netherlands Territory and the continental shelf with the aim of making information supplied by the Dutch government easily and clearly accessible. The portal is administered by TNO, *Geological Survey of the Netherlands* on the authority of the Ministry of Economic Affairs.

## DEFINITIONS OF SELECTED TERMS

**Territory/Netherlands Territory:**

In this review, Territory and Netherlands Territory refer to the Netherlands mainland and that part of the Netherlands territorial waters located on the landward side of the line referred to in article 1, sub c, of the Mining Act.

**Continental shelf:**

In this review, continental shelf and Netherlands continental shelf refer to that part of the continental shelf over which the Kingdom of the Netherlands has sovereign rights and which is located on the seaward side of the line referred to in article 1, sub c, of the Mining Act.

**Reconnaissance licence:**

a licence to carry out a reconnaissance survey on the continental shelf; since 1 January 2003 a reconnaissance survey has only been mandatory for certain areas.

**Exploration licence:** A licence to explore for the minerals stipulated therein.

**Production licence:**

A licence to produce the mineral resources specified in the licence, and also to explore for these mineral resources.

**Seismic surveys:**

This review differentiates between 2D and 3D seismic techniques. There is a long tradition of two-dimensional (2D) seismic surveying in the oil industry. Vibrations are generated along a line on the surface of the ground. They are reflected back by the layers in the earth's crust and recorded by geophones or hydrophones. As the vibrations do not always propagate solely in the vertical plane underneath the recording line, the representations of geological structures in the 2D seismic sections only approximate the real-life situation. The approximation is far superior in 3D seismic surveys, in which a large number of recording lines are positioned close together in a relatively small area. Modern electronic data processing makes it possible to correct for deviations of the wave fronts that are not in the vertical plane underneath an individual recording line, making it possible to generate an accurate model of the geological structures at any desired location.

**Wells:**

- Exploration well: a well to explore a prospective underground accumulation of oil, or gas, or of both;
- Appraisal well: A well drilled to establish the volume and extent of a gas field, or an oilfield, or a combined gas/oilfield;
- Production well: A well drilled in order to produce a gas field or an oilfield.

**Gas field / oilfield:**

A natural, isolated accumulation of gas and/or oil in an underground reservoir consisting of a porous rock that is capped or enclosed by impermeable rock. In this review, the terms reservoir, field and accumulation are used synonymously.

**Resource categories and definitions:**

In the following definitions, natural gas and oil are referred to collectively as hydrocarbons.

**1 Gas/oil initially in place (GIIP/OIIP)**

the total volume of hydrocarbons initially present in a reservoir, calculated on the basis of the mean values of the parameters used in the calculations.

**2 Expected initial reserves**

the total volume of hydrocarbons in a reservoir estimated to be ultimately commercially recoverable, calculated on the basis of the mean values of the parameters used in the calculations.

**3 Proven initial reserves**

the volume of hydrocarbons in a reservoir estimated to be ultimately commercially recoverable (with a 90% probability, based on an expectation curve).

**4 Remaining expected reserves**

that part of the expected initial reserves remaining after subtracting the cumulative production (this is the total volume of hydrocarbons produced from the reservoir concerned by the end of the year under review).

**5 Remaining proven reserves**

the volume of hydrocarbons with a 90% probability of still being recoverable from a reservoir. This volume is calculated by subtracting the cumulative production from the proven initial reserves.

**6 Contingent resources**

The volume of hydrocarbons in a reservoir estimated to have a 90% probability of being potentially recoverable, but currently not considered commercially recoverable due to one or more contingencies. In this annual review, only the contingent resources in the 'pending production' subclass are considered.

**7 Expected contingent resources**

The volume of hydrocarbons in a reservoir expected to be commercially viable to produce under certain conditions. It is calculated using mean values of the parameters. In this annual review, only the contingent resources in the 'pending production' subclass are considered.

**8 Future reserves**

The volumes of hydrocarbons not yet proven by drilling but having a certain possibility of success of contributing to reserves in the future. The following datasets and definitions have been used to estimate future reserves:

**a. Prospect database**

Database containing all prospective structures ('prospects') known to the Netherlands government which may potentially contain gas or oil (future reserves). The main

source of data for this database is the annual reports submitted by the operating companies in accordance with article 113 of the Mining Act.

**b. Prospect portfolio**

The selection of prospects from the prospect database located within 'proven play' areas.

**c. Exploration potential**

Cumulative 'risked volumes' of all prospects in the prospect portfolio that meet certain selection criteria. Since 1992 the prospect folio as reported in the exploration potential reports has contained only those prospects with an expected reserve exceeding a certain minimum value. In certain reports the term 'firm futures' has been used. It is largely synonymous with exploration potential.

**d. Potential futures in proven plays**

Volume of gas expected to be present in as yet unmapped structures in the 'proven play' areas.

**e. Potential futures in as yet unproven plays**

Volume of gas expected to be present in valid plays that have not yet been proven in the Netherlands.

**f. Potential futures in hypothetical plays**

Volume of gas in plays in which one or more of the basic play elements such as reservoir, seal and source rock are not yet known.

In the definitions above, the term 'expected' is used in the statistical sense and thus the figure given represents the expected value (or expectation). The following explanation may be helpful.

All data used for the purpose of calculating volumes have an intrinsic uncertainty. By processing these uncertainties statistically, an expectation curve can be determined for each accumulation. This is a cumulative probability distribution curve, i.e. a graph in which reserve values are plotted against the associated probabilities that they will be achieved or exceeded. As production from a hydrocarbon reservoir progresses, various uncertainties decrease and the expected value will deviate less and less from the 50% value on the cumulative probability distribution curve.

In practice, the stated reserves of a given field are the expected values. This is the most realistic estimate of the volume of hydrocarbons present in a reservoir.

The recoverability of hydrocarbons from an accumulation is determined by the geological and reservoir characteristics of that accumulation, the recovery techniques available at the time of reporting and the economic conditions prevailing at that time.

**Probabilistic summation of the proven reserves:**

In this method, the probability distributions of the reserves of the individual fields are combined in order to take account of the uncertainties inherent to all reserve estimates.

The result of applying the probabilistic summation method is that the total figure obtained for the proven reserves in the Netherlands is statistically more reliable. In other words, the probability that the actual reserves exceed the value stated is 90%.

**Exploration potential:**

The exploration potential has been calculated using the ExploSim program, which is described in

LUTGERT, J., MIJNLIEFF, H. & BREUNESSE, J. 2005. Predicting gas production from future gas discoveries in the Netherlands: quantity, location, timing, quality. In: DORE, A. G. & VINING, B. A. (eds) Petroleum Geology: North-West Europe and Global Perspectives—

Proceedings of the 6th Petroleum Geology Conference, 77–84. q Petroleum Geology Conferences Ltd. Published by the Geological Society, London.

The most important parameters used to determine the exploration potential (i.e. to perform the economic evaluation of prospects) on the basis of the discounted cash flow model are gas price ((21.5ct/m<sup>3</sup>), deduction of costs based on ‘Unit Of Production’ and the standard GasTerra depletion rules.

Important scenario parameters are the number of exploration wells per year (11) and the incorporation of the construction and dismantling of the infrastructure.

**Units:**

**Standard m<sup>3</sup>:** natural gas and oil reserves are expressed in cubic metres at a pressure of 101.325 kPa (or 1.01325 bar) and 15°C. This m<sup>3</sup> is defined as a standard m<sup>3</sup> in Standard no. 5024-1976(E) of the International Organisation for Standardisation (ISO) and is usually abbreviated Sm<sup>3</sup>.

**Normal m<sup>3</sup>:** natural gas and oil reserves are expressed in cubic metres at a pressure of 101.325 kPa (or 1.01325 bar) and 0°C. This m<sup>3</sup> is defined as a normal m<sup>3</sup> in Standard no. 5024-1976(E) of the International Organisation for Standardisation (ISO) and is usually abbreviated Nm<sup>3</sup>.

**Groningen gas equivalent:** In order to be able to incorporate volumes of natural gas of different qualities in calculations, they have been converted to Groningen gas equivalents (Geq). This is achieved by converting the volume of gas that differs in quality from the gas in the Groningen field to a volume of gas that is hypothetically of the same quality as the gas in the Groningen field (which is 35.17 Mega joules upper value per m<sup>3</sup> of 0°C and 101.325 kPa. or 1.01325 bar).

One Nm<sup>3</sup> gas with a calorific value of 36.5 MJ is equivalent to 36.5/35.17 Nm<sup>3</sup> Geq .

The Groningen gas equivalent is commonly used in the Netherlands, including by N.V. Netherlands Gasunie.

Figures given as Groningen gas equivalents can easily be converted into equivalents for other fuels, such as tonnes of oil equivalents (TOE) and coal equivalents (CE).

Fuel	Unit	Giga joule	Giga calorie	Oil equiv. tonnes	Oil equiv. barrels	Coal equiv. tonnes	Gas equiv. 1 000 m <sup>3</sup>
Fuelwood (dry)	tonnes	13.51	3.23	0.32	2.36	0.46	0.43
Coal	tonnes	29.30	7.00	0.70	5.11	1.00	0.93
Lignite	tonnes	17.00	4.06	0.41	2.96	0.58	0.54
Coke	tonnes	28.50	6.81	0.68	4.97	0.97	0.90
Coke-oven gas	1000 m <sup>3</sup>	17.60	4.20	0.42	3.07	0.60	0.56
Blast furnace gas	1000 m <sup>3</sup>	3.80	0.91	0.09	0.66	0.13	0.12
Crude oil	tonnes	42.70	10.20	1.02	7.45	1.46	1.35
Oil equivalent	tonnes	41.87	10.00	1.00	7.30	1.43	1.32
Refinery gas	1000 m <sup>3</sup>	46.10	11.01	1.10	8.04	1.57	1.46
LPG	1000 m <sup>3</sup>	45.20	10.79	1.08	7.88	1.54	1.43
Naphtha	tonnes	44.00	10.51	1.05	7.67	1.50	1.39
Aviation fuel	tonnes	43.49	10.39	1.04	7.58	1.48	1.37
Petrol	tonnes	44.00	10.51	1.05	7.67	1.50	1.39
Paraffin	tonnes	43.11	10.29	1.03	7.52	1.47	1.36
Domestic fuel oil	tonnes	42.70	10.20	1.02	7.45	1.46	1.35
Heavy fuel oil	tonnes	41.00	9.79	0.98	7.15	1.40	1.30
Petroleum coke	tonnes	35.20	8.41	0.84	6.14	1.20	1.11
Natural gas	1000 m <sup>3</sup>	31.65	7.56	0.76	5.52	1.08	1.00
Electricity *	MWh	3.60	0.86	0.09	0.63	0.12	0.11

- \* In this energy conversion table the energy value of one MWh electricity is to be understood as the energy content of a generated unit of electricity. In order to produce this unit of energy, more energy is necessary. The amount required depends on the efficiency of the conversion.

## **APPENDICES**

## Exploration, production and storage licences as at 1 January 2015

Names of the exploration, production and storage licences, Netherlands Territory, as indicated on the map on the next page:

<b>Exploration licences</b>	
E1	Akkrum
E2	Engelen
E3	Follega
E4	Hemelum
E5	IJsselmuiden
E6	Lemsterland
E7	Noord-Brabant
E8	Noordoostpolder
E9	Oosterwolde
E10	Opmeer
E11	Peel
E12	Schagen
E13	Schiermonnikoog-Noord
E14	Terschelling-Noord
E15	Utrecht

<b>Applications for exploration licences</b>	
E16	Breda-Maas
E17	De Kempen
E18	Midden-Nederland
E19	Waskemeer

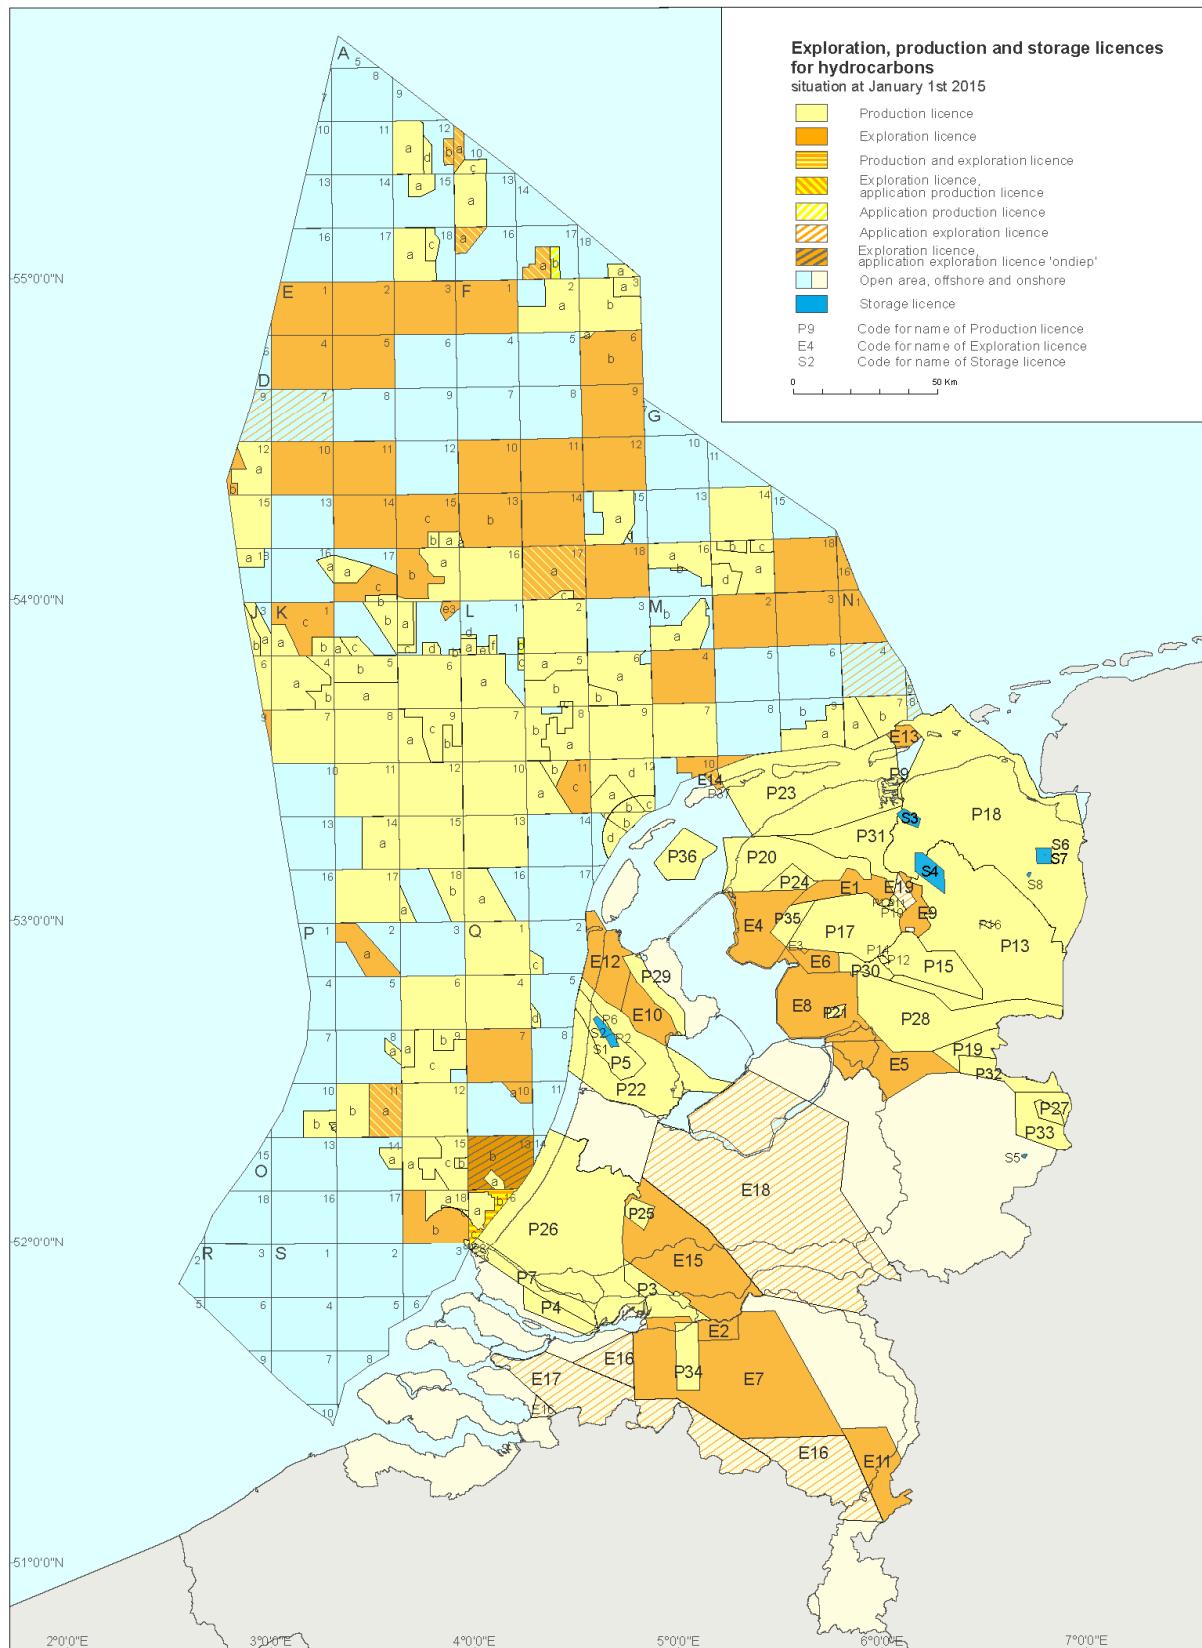

<b>Production licences</b>	
P1	Akkrum 11
P2	Alkmaar
P3	Andel V
P4	Beijerland
P5	Bergen II
P6	Bergermeer
P7	Botlek II
P8	Botlek-Maas
P9	De Marne
P10	Donkerbroek
P11	Donkerbroek-West
P12	Drenthe IIA
P13	Drenthe IIB
P14	Drenthe IIIA
P15	Drenthe IIIB
P16	Drenthe IV
P17	Gorredijk
P18	Groningen
P19	Hardenberg
P20	Leeuwarden
P21	Marknesse
P22	Middelie
P23	Noord-Friesland
P24	Oosterend
P25	Papekop
P26	Rijswijk
P27	Rossum-De Lutte
P28	Schoonebeek
P29	Slootdorp
P30	Steenwijk
P31	Tietjerksteradeel
P32	Tubbergen
P33	Twenthe
P34	Waalwijk
P35	Zuid-Friesland III
P36	Zuidwal

<b>Applications for production licences</b>	
P37	Terschelling-Noord

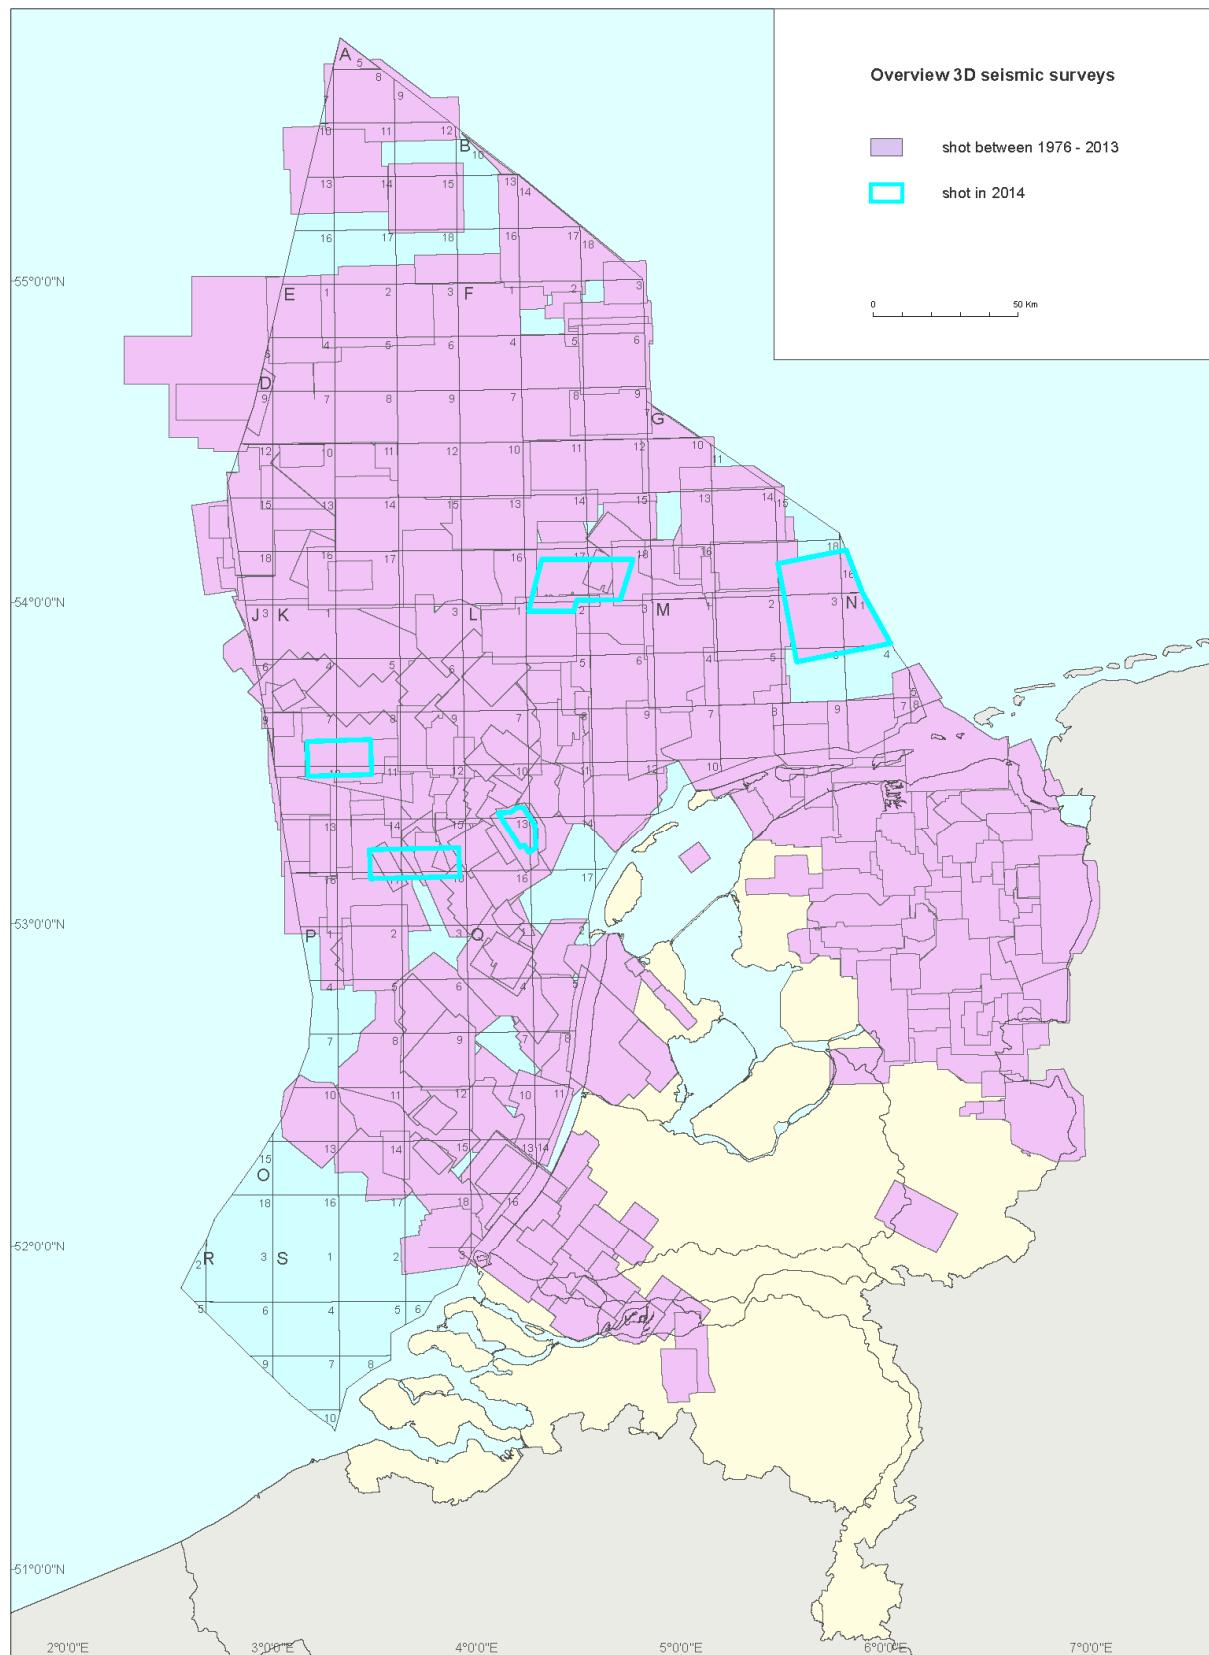

<b>Storage licences</b>	
S1	Alkmaar
S2	Bergermeer
S3	Grijpskerk
S4	Norg
S5	Twenthe-Rijn De Marssteden
S6	Winschoten II
S7	Winschoten III
S8	Zuidwending

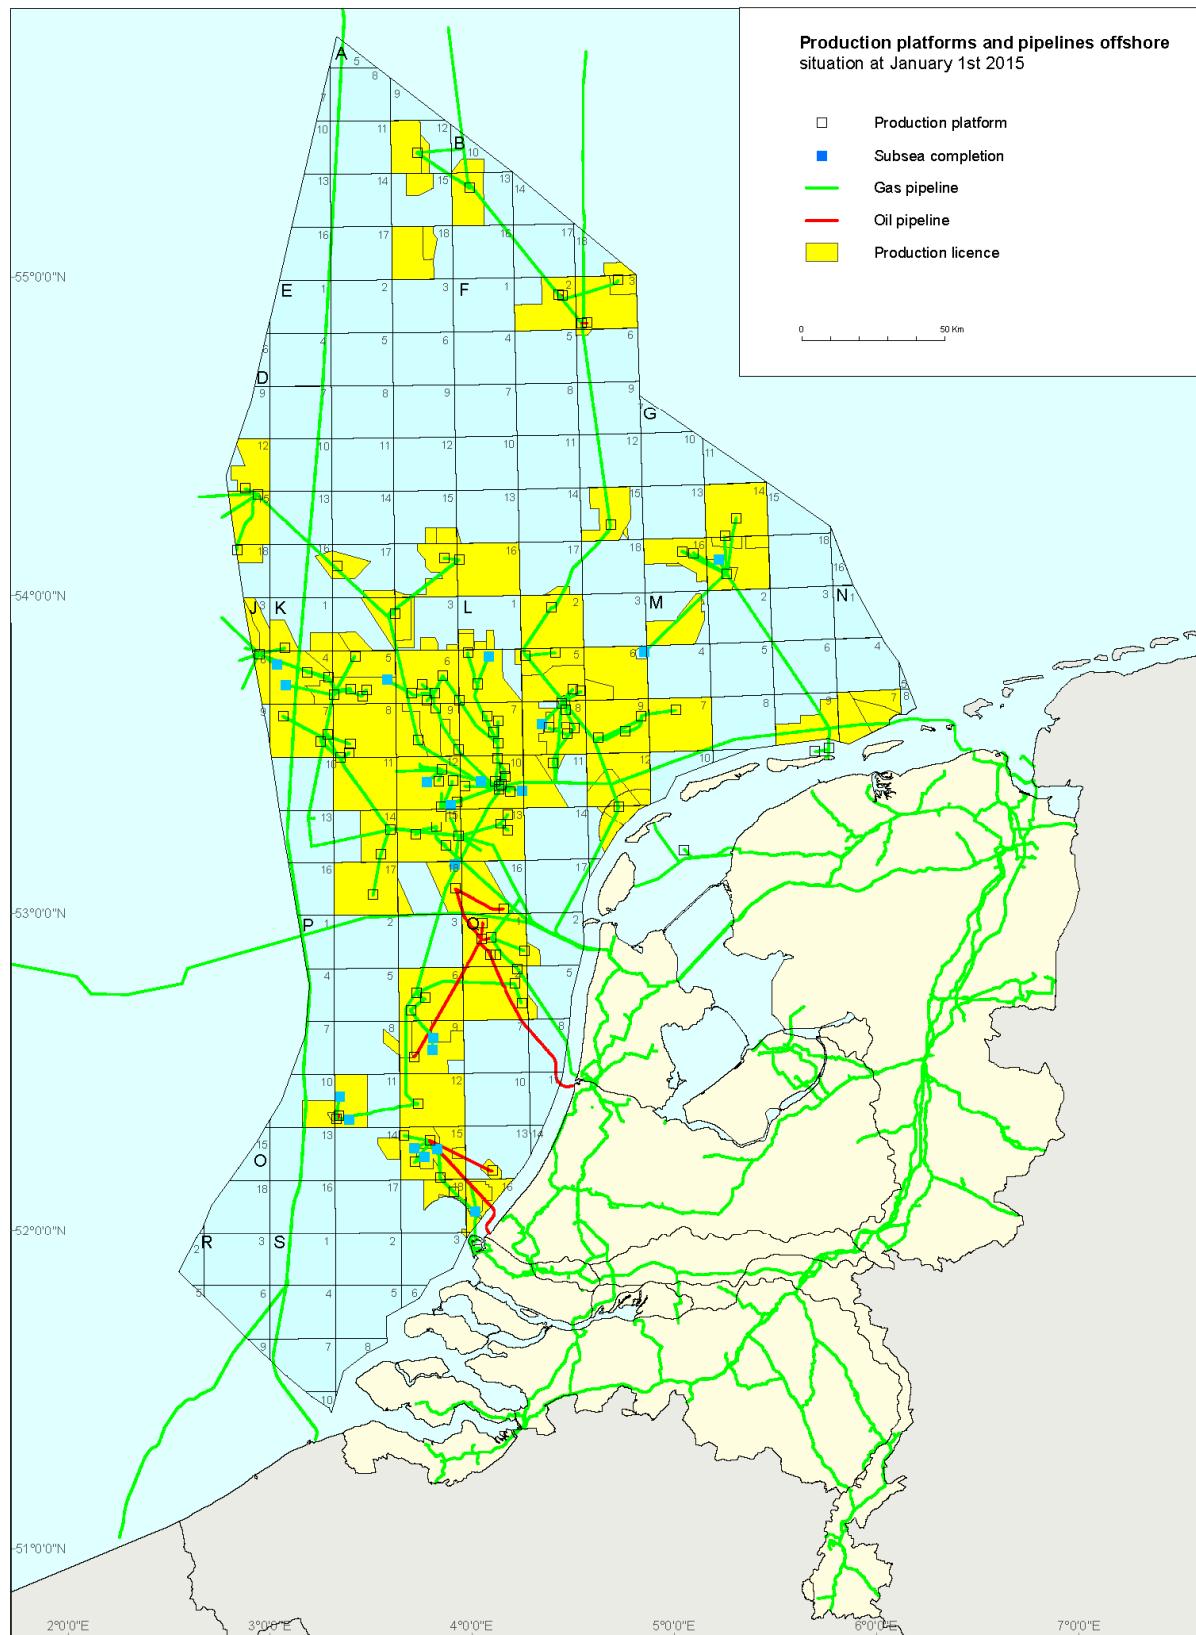

**Wells and changes in licence situation as at 1 January 2015**

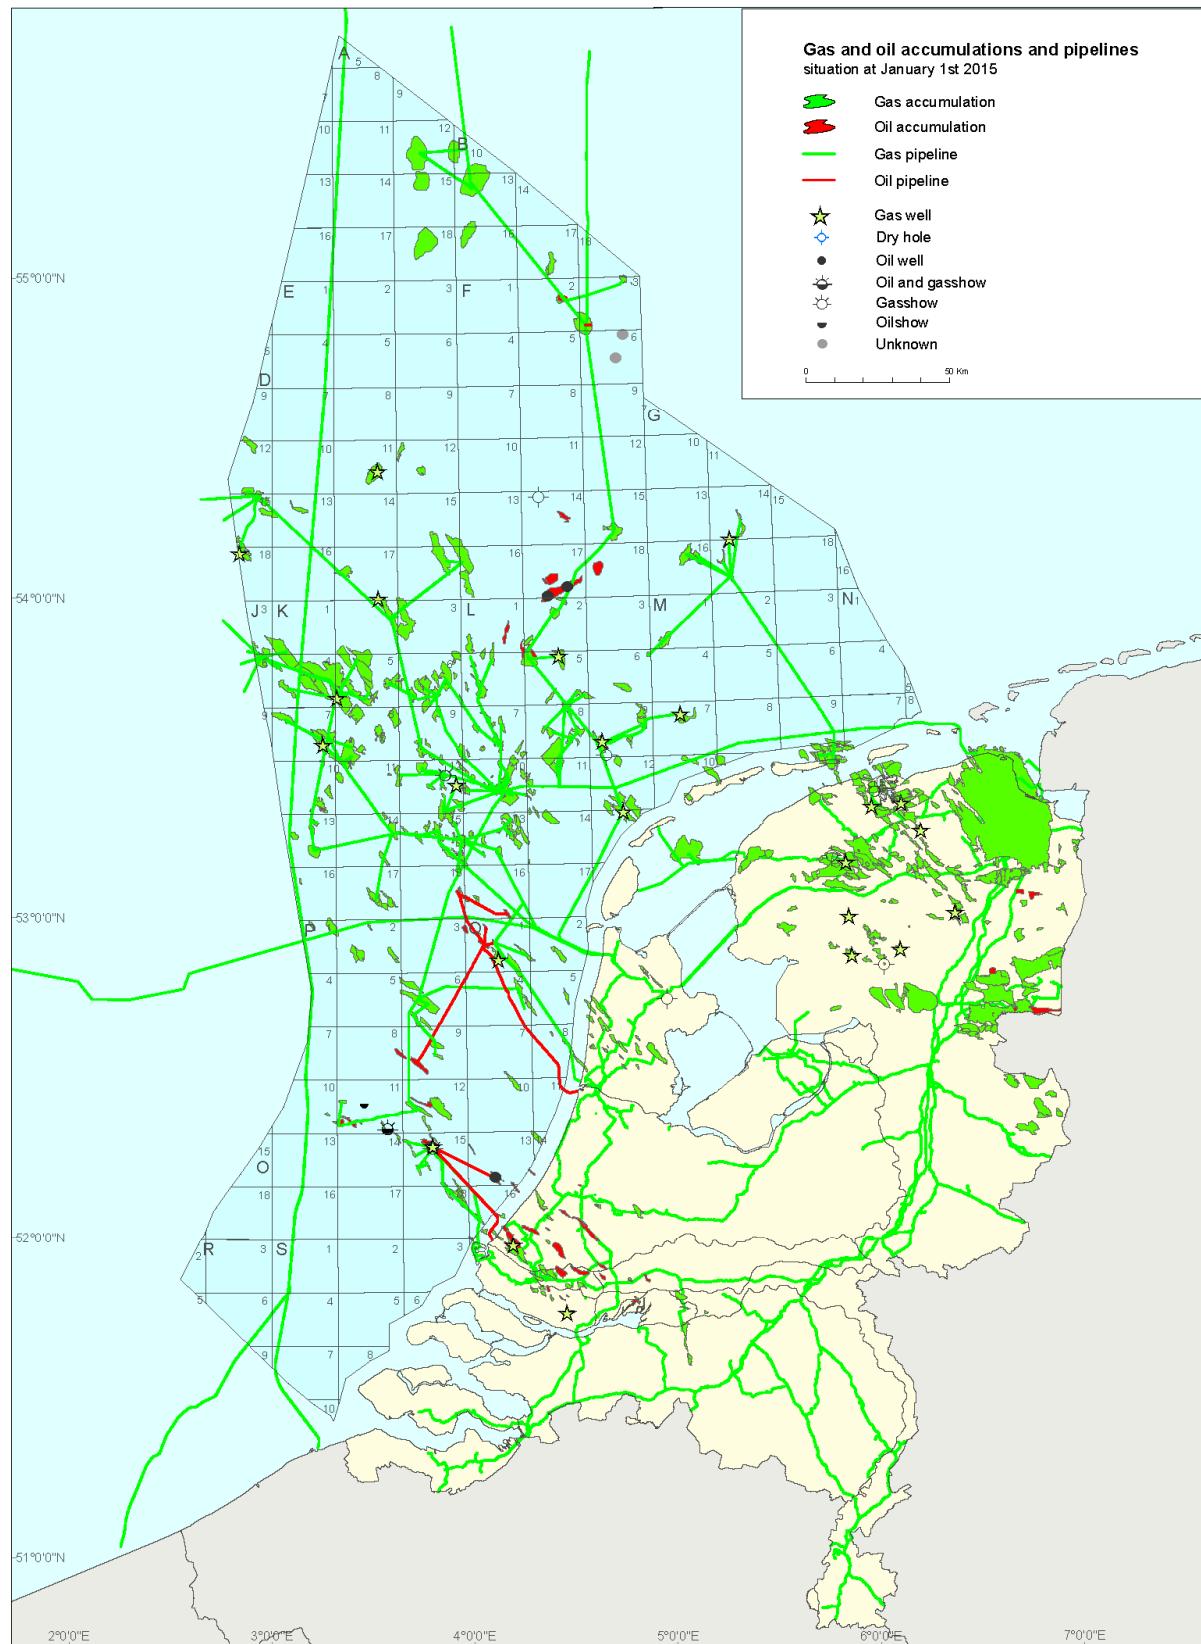

## 3D seismic surveys

## Production platforms and pipelines

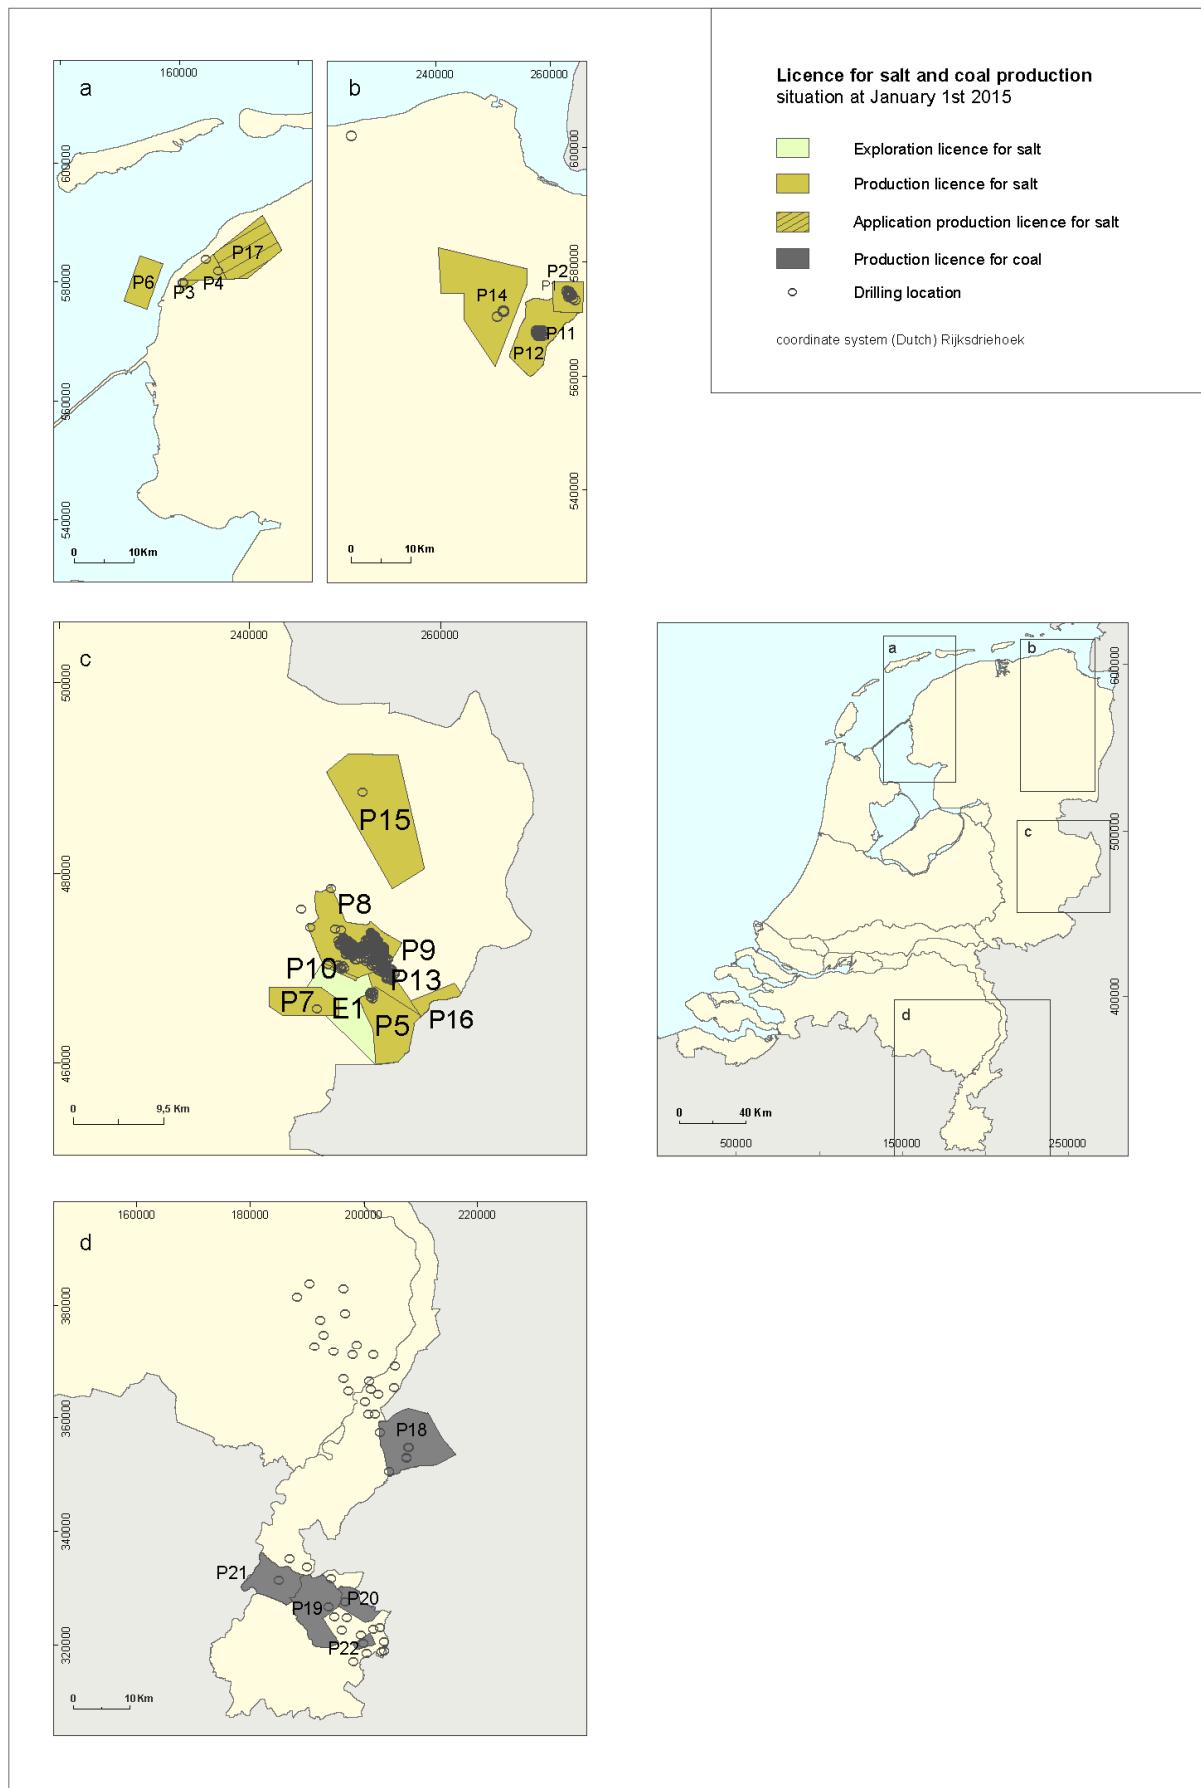

**Gas and oil accumulations and pipelines as at 1 January 2015**

## Licences for rock salt and for coal as at 1 January 2015

Names of rock salt and coal exploration and production licences for Netherlands Territory, as indicated on the map on the next page:

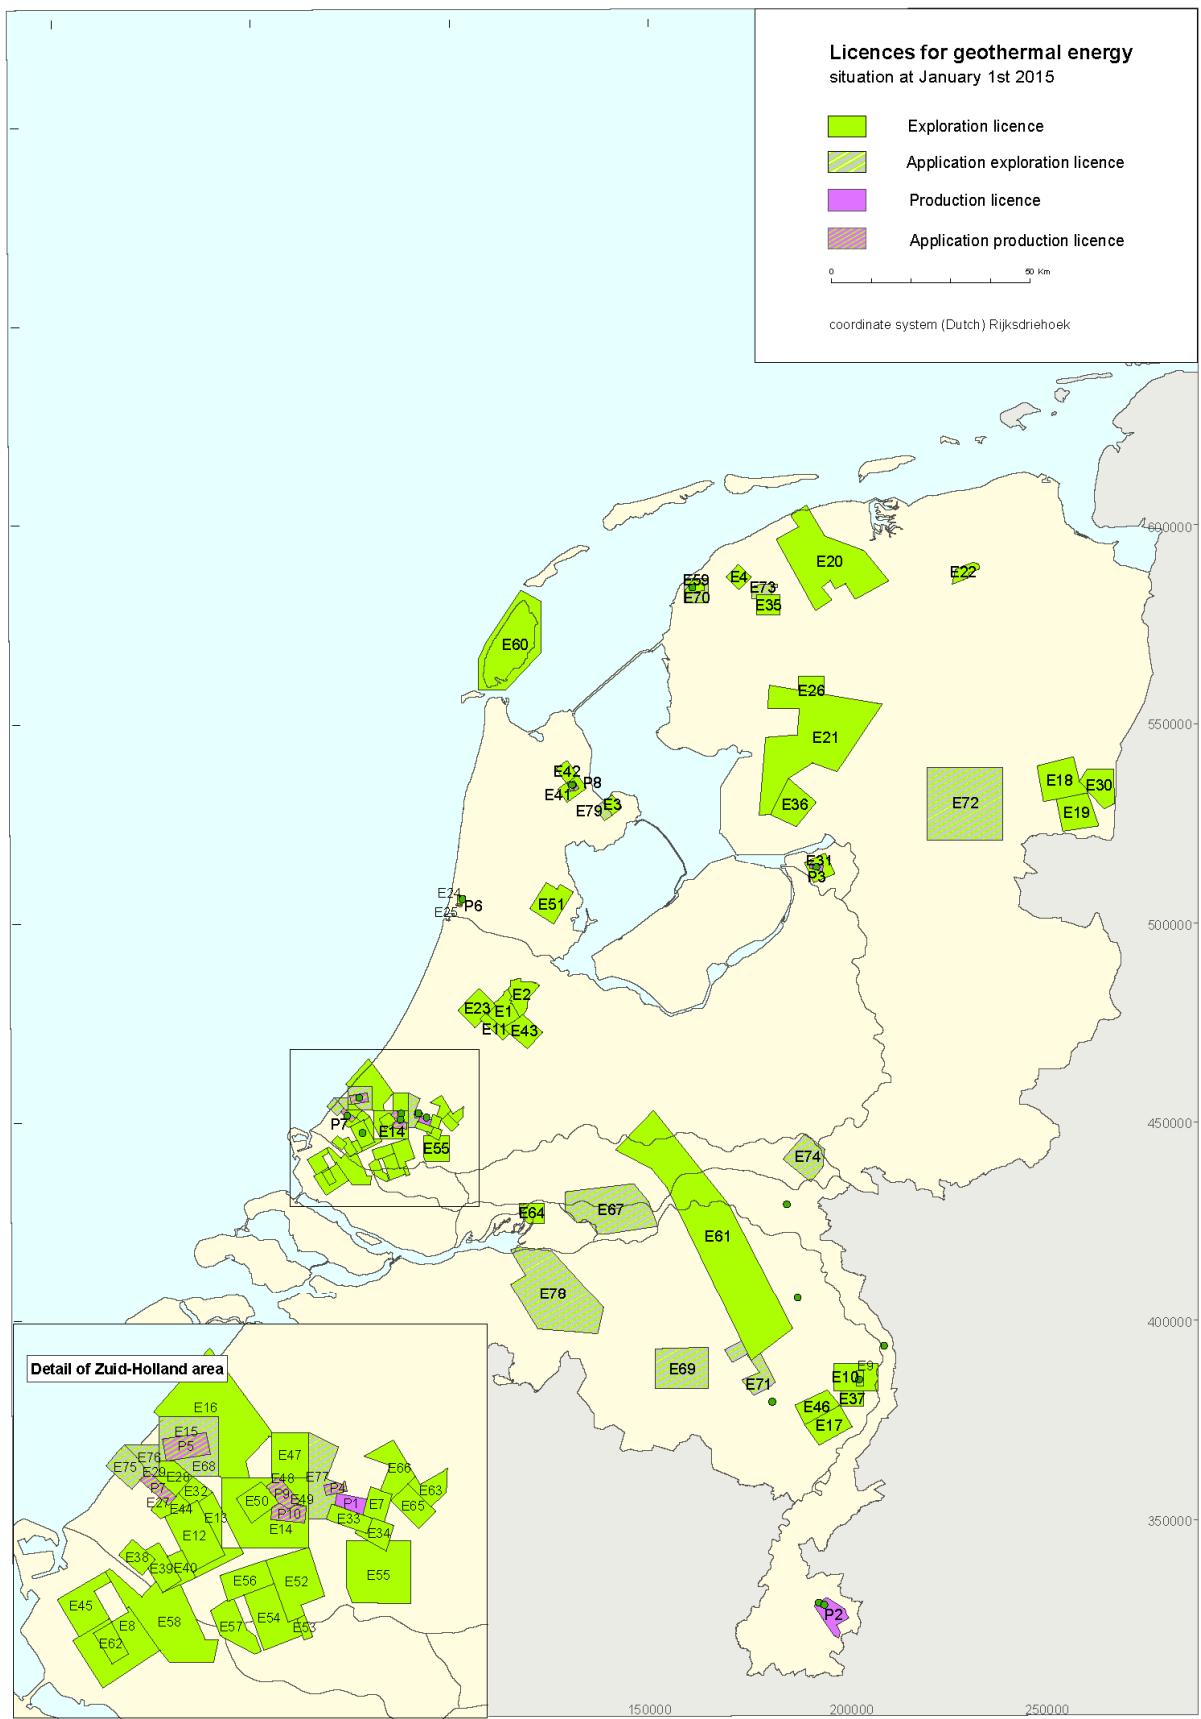

<b>Exploration licences for rock salt</b>	
E1	Zuidoost-Twente
<b>Production licences for rock salt</b>	
P1	Adolf van Nassau II
P2	Uitbreiding Adolf van Nassau II
P3	Adolf van Nassau III
P4	Uitbreiding Adolf van Nassau III
P5	Barradeel
P6	Barradeel II
P7	Buurse
P8	Havenmond
P9	Isidorushoeve
P10	Twenthe-Rijn
P11	Uitbreiding Twenthe-Rijn
P12	Twenthe-Rijn Helmerzijde
P13	Twenthe-Rijn Oude Maten
P14	Veendam
P15	Weerselo
P16	Zuidoost-Enschede
<b>Production licence applications for rock salt</b>	
P17	Barradeel-Oost
<b>Production licences for coal</b>	
P18	Staatsmijn Beatrix
P19	Staatsmijn Emma
P20	Staatsmijn Hendrik
P21	Staatsmijn Maurits
P22	Staatsmijn Wilhelmina

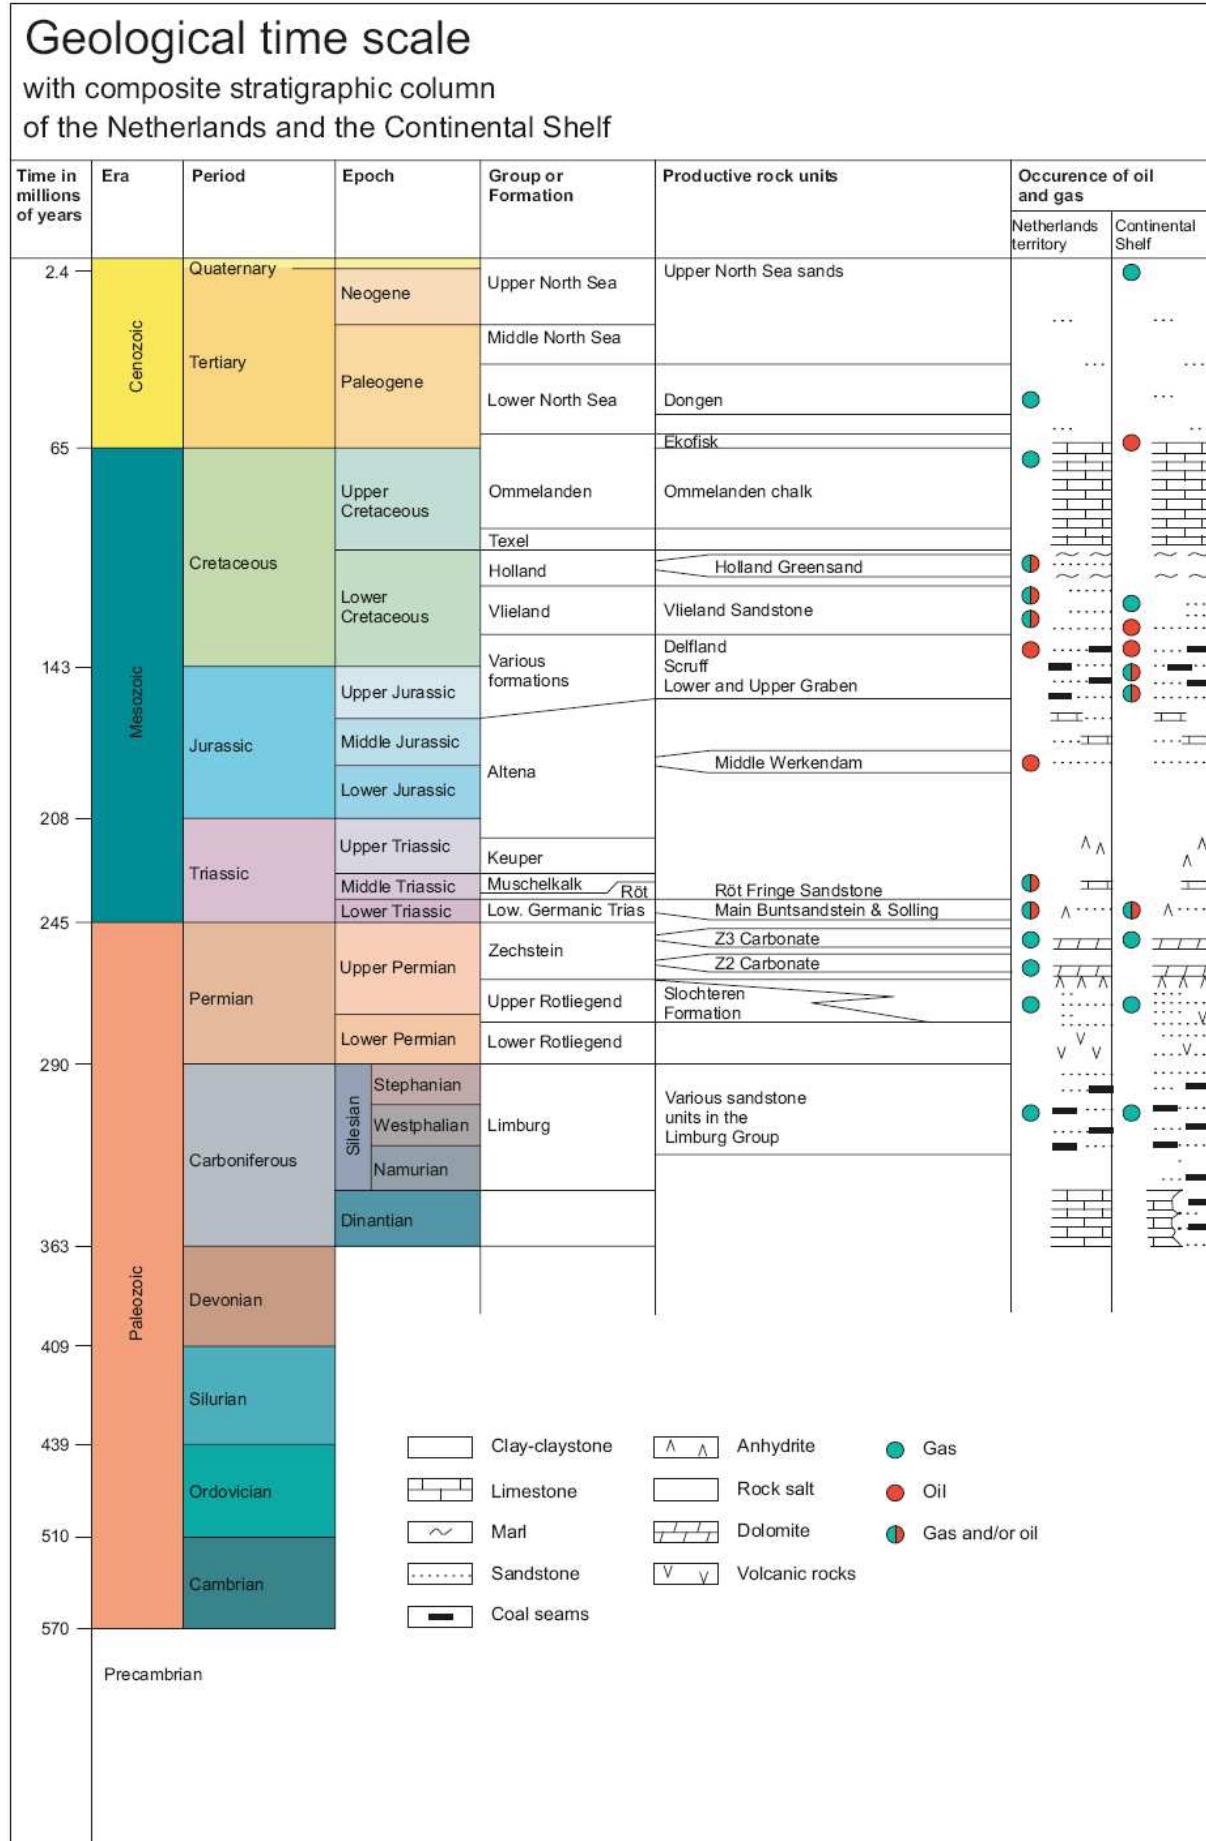

## Geothermal energy licences as at 1 January 2015

Names of geothermal energy exploration and production licences for Netherlands Territory, as indicated on the map on the next page:

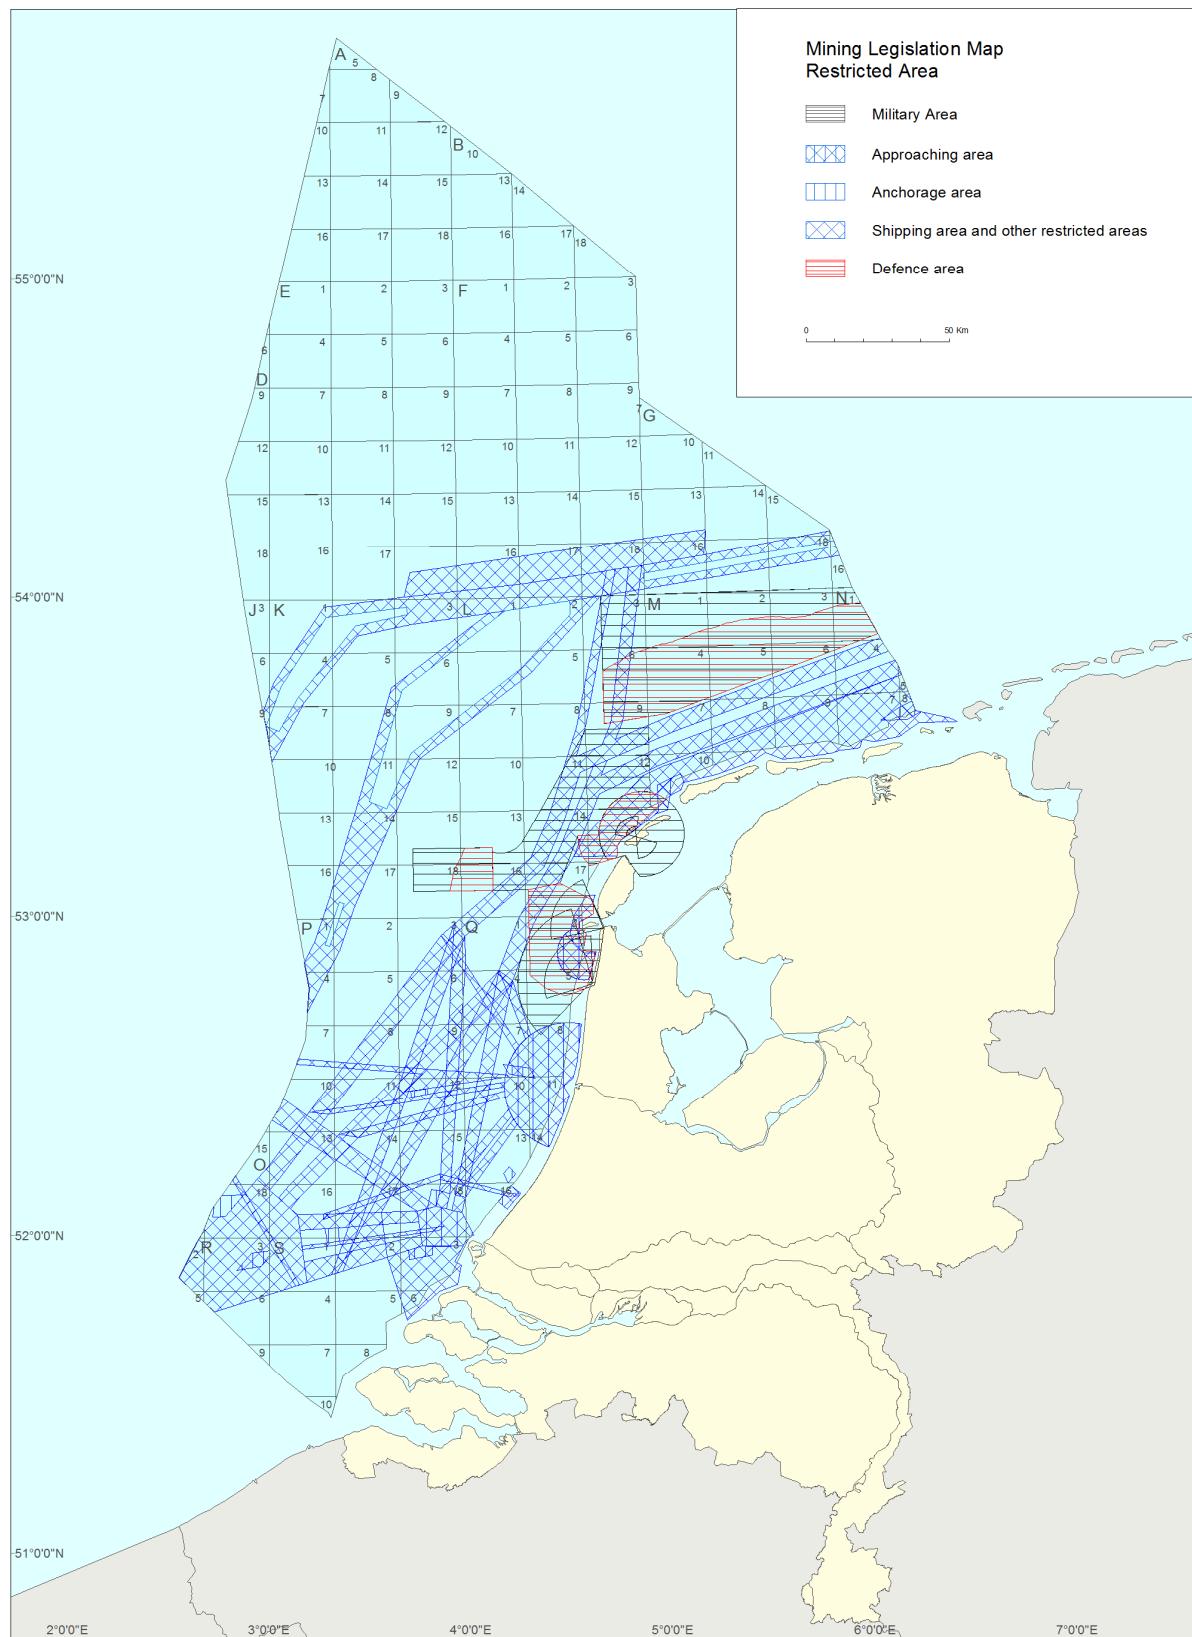

<b>Exploration licences</b>					
E1	Aalsmeer	E24	Heemskerk	E47	Pijnacker-Nootdorp 3
E2	Amstelveen	E25	Heemskerk 2	E48	Pijnacker-Nootdorp 4
E3	Andijk	E26	Heerenveen	E49	Pijnacker-Nootdorp 5
E4	Berlikum	E27	Honselersdijk	E50	Pijnacker-Nootdorp 6
E5	Bleiswijk	E28	Honselersdijk 2	E51	Purmerend
E6	Bleiswijk 3	E29	Honselersdijk 4	E52	Rotterdam 2
E7	Bleiswijk 4	E30	Klazienaveen	E53	Rotterdam 3
E8	Brielle 2	E31	Koekoekspolder Ila	E54	Rotterdam 4
E9	Californie I	E32	Kwintsheul	E55	Rotterdam 5
E10	Californie 2	E33	Lansingerland	E56	Rotterdam 6-Trias
E11	De Kwakel	E34	Lansingerland 4	E57	Rotterdam-Vlaardingen
E12	De Lier	E35	Leeuwarden	E58	Rozenburg
E13	De Lier 3	E36	Luttelgeest	E59	Sexbierum
E14	Delft IV	E37	Maasbree	E60	Texel
E15	Den Haag	E38	Maasdijk	E61	Utrecht-
E16	Den Haag 2	E39	Maasland		Noord-Brabant
E17	Egchel	E40	Maasland 2	E62	Vierpolders
