## 1 Procedure

Since 2006, OG-GPS processes GPS data of three subsidence monitoring stations near the Waddenze in a network with six reference stations on a monthly bases, see Fig. 1. During processing with GPS software package GNSMART, the coordinates of these reference stations are kept fixed (standard deviation 0.0 mm), whereas the coordinates of the permanent monitoring stations get some freedom to move. However, in reality there is always the possibility that the positions of the reference stations change as well.

To deal with this problem, the coordinates of all reference station will be recalculated and eventually updated on a yearly basis (middle of the year). OG-GPS follows the advice of Geo++, the software company who developed GNSMART. The advise was formulated as follow:

"To detect the small moving of the gas field stations you should keep the reference station fixed. We suggest to check periodically the used reference station. In case of detected reference station movements, the coordinates of the reference station must be updated."

The following procedure is performed ones per year:

1. Recalculate all reference station coordinates; i.e. giving them an a priori standard deviation of 1.0 mm for the horizontal position and 2.0 mm for the height.
2. Change the reference station coordinates for stations with a height deviation of more than 2 mm compared to the existing coordinates.
3. Process the network again with all reference stations fixed to be able to calculate the influence of the new reference station coordinates on the permanent monitoring stations.
4. Evaluation of the results.

Fig. 1. Reference stations (yellow) and permanent monitoring stations (green)

## 2 Reference checks

### 2.1 Check 2009

Time series: 17-05-2009 until 27-06-2009

Duration: 6 weeks

Reference: coordinates 2006 (see appendix A.1)

The differences between the reference station coordinates of 2006 and the recalculated coordinates is shown in Table 1. Notice that the stations 0687 (Borkum) and drac (Drachten) show a height deviation of more than 2 mm. Drachten has subsided even 6 mm in 3 years.

Station	dX (m)	dY (m)	dZ (m)
0687	0.0072	0.0076	0.0031
ball	-0.0001	-0.0006	-0.0003
drac	-0.0030	0.0027	-0.0061
schi	-0.0018	-0.0016	0.0006
ters	0.0005	-0.0061	0.0002
wsra	-0.0036	0.0021	-0.0011

**Table 1. Differences between coordinates 2006 and recalculated coordinates**

New reference station coordinates are calculated for Borkum and Drachten, these can be found in appendix A.2 (Reference station coordinates 2009). All data since May 3<sup>th</sup> 2009 is processed with the new reference station coordinates for Borkum and Drachten.

Table 2 shows the influence of the new reference station coordinates for Borkum and Drachten on the permanent monitoring stations. Notice the extra subsidence of almost 1 mm at Moddergat and Anjum, while for ame1 the result did not change. An explanation for this effect is that Moddergat and Anjum are located somewhat closer to reference station Drachten (see Fig. 1), that subsided 6 mm relative to most other reference stations. Also the stable station of Westerbork may have contributed in the minor influences on Moddergat and Anjum.

Station	dx (m)	dy (m)	dH (m)
ame1	0.0002	0.0004	-0.0001
anim	-0.0002	0.0019	-0.0009
modd	-0.0002	0.0013	-0.0006

**Table 2. Influence of the new reference station coordinates on the permanent monitoring stations**

## 2.2 Check 2010

Time series: 23-05-2010 until 03-07-2010

Duration: 6 weeks

Reference: coordinates 2009 (see appendix A.2)

The differences between the reference station coordinates of 2009 and the recalculated coordinates is shown in Table 1. Notice that all height differences are within the maximum tolerance of 2 mm. This makes it unnecessary to change the reference station coordinates. All stations will maintain the coordinates of 2009, see appendix A.2.

Station	dx (m)	dy (m)	dH (m)
0687	0.0004	0.0012	-0.0018
ball	0.0006	0.0019	-0.0011
drac	0.0006	0.0031	0.0012
schi	-0.0007	-0.0007	-0.0002
ters	0.0028	-0.0061	-0.0015
wsra	-0.0037	0.0052	0.0004

**Table 1. Differences between coordinates 2009 and recalculated coordinates**

## 2.3 Check 2011

Time series: 17-04-2011 until 28-05-2011

Duration: 6 weeks

Reference: coordinates 2009 (see appendix A.2)

The differences between the reference station coordinates of 2009 and the recalculated coordinates are shown in Table 1. Notice that the stations 0687 (Borkum) and ters (Terschelling) show a height deviation of more than 2 mm. The deviation of station Borkum is most likely related to an antenna replacement on October 20<sup>th</sup> 2010, in spite of the fact that a new individual antenna calibration file has been used for processing since that time.

Station	dx (m)	dy (m)	dH (m)
0687	0.0006	0.0006	-0.0037
ball	0.0013	0.0019	0.0012
drac	0.0000	0.0050	-0.0004
schi	-0.0009	-0.0013	0.0010
ters	0.0033	-0.0071	0.0024
wsra	-0.0039	0.0058	-0.0011

**Table 1. Differences between coordinates 2009 and recalculated coordinates**

The recalculated coordinates are applied for reference stations Borkum and Terschelling, these coordinates can be found in appendix A.3 (Reference station coordinates 2011).

The time series is processed again to calculate the influence of the new reference station coordinates for Borkum and Terschelling on the permanent monitoring stations. Table 2 shows the results. Notice that station Anjum (anjm), which is located closest to Borkum, gets the largest correction.

Station	dx (m)	dy (m)	dH (m)
ame1	0.0002	-0.0003	-0.0003
anjm	0.0000	0.0000	-0.0006
modd	0.0002	0.0000	-0.0004

**Table 2. Influence of the new reference station coordinates on the permanent monitoring stations**

All data since May 1st 2011 has been processed with the new reference station coordinates for Borkum and Terschelling.

Date  
June 3<sup>rd</sup>, 2011
